

Testing the Pygmen \TeX package

José Romildo Malaquias

February 1, 2022

1 TEST

./pygmentex.py

2 First examples

A simple verbatim text is the first example.

```
1 \begin{pygmented}{}
2 Hello world!
3 This is a simple demonstration text.
4 \end{pygmented}
```

```
Hello world!
  This is a simple demonstration text.
```

The followig C program reads two integers and calculates their sum.

```
1 \begin{pygmented}{lang=c}
2 #include <stdio.h>
3 int main(void)
4 {
5     int a, b, c;
6     printf("Enter two numbers to add: ");
7     scanf("%d%d", &a, &b);
8     c = a + b;
9     printf("Sum of entered numbers = %d\n", c);
10    return 0;
11 }
12 \end{pygmented}
```

```
#include <stdio.h>
int main(void)
{
    int a, b, c;
    printf("Enter two numbers to add: ");
    scanf("%d%d", &a, &b);
    c = a + b;
    printf("Sum of entered numbers = %d\n", c);
    return 0;
}
```

```
}
```

```
1 In this program, \pyginline[lang=c]|int| is a type and
2 \pyginline[lang=c]|"Enter two numbers to add: "| is a literal string.
```

In this program, `int` is a type and `"Enter two numbers to add: "` is a literal string.

Next you can see a Java program to calculate the factorial of a number.

```
1 \inputpygmented[lang=java]{Factorial.java}
```

```
public class Factorial
{
    public static void main(String[] args)
    {
        int number = 5;
        int factorial = 1;
        for (int i = 1; i <= number; i++)
            factorial = factorial * i;
        System.out.println("Factorial of " + number +
                           " is " + factorial);
    }
}
```

3 Choosing different Pygments styles

Instead of using the default style you may choose another stylesheet provided by Pygments by its name using the `sty` option.

To get a list of all available stylesheets, execute the following command on the command line:

```
$ pygmentize -L styles
```

Creating your own styles is also very easy. Just follow the instructions provided on the website.

As examples you can see a C program typeset with different styles.

```
1 \noindent
2 \begin{minipage}[t]{0.49\linewidth}
3 \begin{pygmented}{lang=c,gobble=4,sty=murphy}
4 #include<stdio.h>
5 main()
6 { int n;
7 printf("Enter a number: ");
8 scanf("%d",&n);
9 if ( n%2 == 0 )
10 printf("Even\n");
11 else
12 printf("Odd\n");
13 return 0;
14 }
15 \end{pygmented}
16 \end{minipage}
17 \hfil
```

```

18 \begin{minipage}[t]{0.49\linewidth}
19 \begin{pygmented}{lang=c,gobble=4,sty=trac}
20 #include<stdio.h>
21 main()
22 { int n;
23 printf("Enter a number: ");
24 scanf("%d",&n);
25 if ( n%2 == 0 )
26 printf("Even\n");
27 else
28 printf("Odd\n");
29 return 0;
30 }
31 \end{pygmented}
32 \end{minipage}

```

```

#include <stdio.h>
main()
{ int n;
  printf("Enter a number: ");
  scanf("%d",&n);
  if ( n%2 == 0 )
    printf("Even\n");
  else
    printf("Odd\n");
  return 0;
}

```

```

#include <stdio.h>
main()
{ int n;
  printf("Enter a number: ");
  scanf("%d",&n);
  if ( n%2 == 0 )
    printf("Even\n");
  else
    printf("Odd\n");
  return 0;
}

```

4 Choosing a font

The value of the option `font` is typeset before the content of the listing. Usually it is used to specify a font to be used. See the following example.

```

1 \begin{pygmented}{lang=scala,font=\rmfamily\scshape\large}
2 object bigint extends Application {
3 def factorial(n: BigInt): BigInt =
4   if (n == 0) 1 else n * factorial(n-1)
5
6 val f50 = factorial(50); val f49 = factorial(49)
7 println("50! = " + f50)
8 println("49! = " + f49)
9 println("50!/49! = " + (f50 / f49))
10 }
11 \end{pygmented}

```

```

object bigint extends Application {
  def factorial(n: BigInt): BigInt =
    if (n == 0) 1 else n * factorial(n-1)

  val f50 = factorial(50); val f49 = factorial(49)
  println("50! = " + f50)
  println("49! = " + f49)
  println("50!/49! = " + (f50 / f49))
}

```

5 Changing the background color

The option `colback` can be used to choose a background color, as is shown in the following example.

```
1 \begin{pygmented}{lang=fsharp,colback=green!25}
2 let rec factorial n =
3   if n = 0
4   then 1
5   else n * factorial (n - 1)
6   System.Console.WriteLine(factorial n)
7 \end{pygmented}
```

```
let rec factorial n =
    if n = 0
    then 1
    else n * factorial (n - 1)
System.Console.WriteLine(factorial n)
```

6 Suppressing initial characters

The option `gobble` specifies the number of characters to suppress at the beginning of each line (up to a maximum of 9). This is mainly useful when environments are indented (Default: empty no character suppressed).

```
1 A code snippet inside a minipage:
2 \begin{minipage}[t]{.5\linewidth}
3 \begin{pygmented}{lang=d,gobble=8}
4   ulong fact(ulong n)
5   {
6   if(n < 2)
7   return 1;
8   else
9   return n * fact(n - 1);
10  }
11 \end{pygmented}
12 \end{minipage}
```

A code snippet inside a minipage:

```
ulong fact(ulong n)
{
    if(n < 2)
        return 1;
    else
        return n * fact(n - 1);
}
```

7 Size of tabulator

The option `tabsize` specifies the number of spaces given by a tab character (Default: 8).

```

1 \begin{pygmented}{lang=common-lisp,tabsize=4}
2 ;; Triple the value of a number
3 (defun triple (X)
4   "Compute three times X."
5   (* 3 X))
6 \end{pygmented}

```

```

;; Triple the value of a number
(defun triple (X)
  "Compute three times X."
  (* 3 X))

```

8 Numbering lines

The lines of a listing can be numbered. The following options control numbering of lines.

- Line numbering is enabled or disabled with the `linenos` boolean option.
- The number used for the first line can be set with the option `linenostart`.
- The step between numbered lines can be set with the option `linenostep`.
- The space between the line number and the line of the listing can be set with the option `linenosep`.

In the following listing you can see a Scheme function to calculate the factorial of a number.

```

1 \begin{pygmented}{lang=scheme,linenos,linenostart=1001,linenostep=2,linenosep=5mm}
2 ;; Building a list of squares from 0 to 9.
3 ;; Note: loop is simply an arbitrary symbol used as
4 ;; a label. Any symbol will do.
5
6 (define (list-of-squares n)
7   (let loop ((i n) (res '()))
8     (if (< i 0)
9       res
10      (loop (- i 1) (cons (* i i) res))))
11 \end{pygmented}

```

```

1001 ;; Building a list of squares from 0 to 9.
1002 ;; Note: loop is simply an arbitrary symbol used as
1003 ;; a label. Any symbol will do.
1004
1005 (define (list-of-squares n)
1006   (let loop ((i n) (res '()))
1007     (if (< i 0)
1008       res
1009       (loop (- i 1) (cons (* i i) res))))

```

9 Captioning

The option `caption` can be used to set a caption for the listing. The option `label` allows the assignment of a label to the listing.

Here is an example:

```
1 \begin{pygmented}{lang=c++,label=lst:test,caption=A \textbf{C++} example}
2 // This program adds two numbers and prints their sum.
3 #include <iostream>
4 int main()
5 {
6   int a;
7   int b;
8   int sum;
9   sum = a + b;
10  std::cout << "The sum of " << a << " and " << b
11  << " is " << sum << "\n";
12  return 0;
13 }
14 \end{pygmented}
```

```
// This program adds two numbers and prints their sum.
#include <iostream>
int main()
{
    int a;
    int b;
    int sum;
    sum = a + b;
    std::cout << "The sum of " << a << " and " << b
              << " is " << sum << "\n";
    return 0;
}
```

1 Listing \ref{lst:test} is a C++ program.

Listing ?? is a C++ program.

10 Escaping to L^AT_EX inside a code snippet

The option `texcomments`, if set to `true`, enables L^AT_EX comment lines. That is, LaTeX markup in comment tokens is not escaped so that L^AT_EX can render it.

The `mathescape`, if set to `true`, enables L^AT_EX math mode escape in comments. That is, `$...$` inside a comment will trigger math mode.

The option `escapeinside`, if set to a string of length two, enables escaping to L^AT_EX. Text delimited by these two characters is read as L^AT_EX code and typeset accordingly. It has no effect in string literals. It has no effect in comments if `texcomments` or `mathescape` is set.

Some examples follows.

```
1 \begin{pygmented}{lang=c++,texcomments}
2 #include <iostream>
```

```

3 using namespace std;
4 main()
5 {
6 cout << "Hello World"; // prints \underline{Hello World}
7 return 0;
8 }
9 \end{pygmented}

```

```

#include <iostream>
using namespace std;
main()
{
    cout << "Hello World"; // prints Hello World
    return 0;
}

```

```

1 \begin{pygmented}{lang=python,mathescape}
2 # Returns  $\sum_{i=1}^n i$ 
3 def sum_from_one_to(n):
4 r = range(1, n + 1)
5 return sum(r)
6 \end{pygmented}

```

```

# Returns  $\sum_{i=1}^n i$ 
def sum_from_one_to(n):
    r = range(1, n + 1)
    return sum(r)

```

```

1 \begin{pygmented}{lang=c,escapeinside=||}
2
3 if (|\textit{condition}|)
4 |\textit{command}_1$|
5 else
6 |\textit{command}_2$|
7 \end{pygmented}

```

```

if (condition)
    command1
else
    command2

```

11 Enclosing command and environment

After being prettified by Pygments, the listings are enclosed in a command (for `\pyginline`) or in an environment (for `pygmented` and `includepygmented`). By default `\pyginline` uses the command `\efbox` from the `efbox` package, and `pygmented` and `includepygmented` use the environment `mdframed` from the `mdframed` package.

The enclosing command or environment should be configurable using a list of key-value pairs written between square brackets.

The enclosing command for `\pyginline` can be changed with the option `inline method`. For instance, in the following the command `\tcbox` from the `tcolorbox` package is used:

```

1 In the previous Java program,
2 \pyginline[lang=java,inline method=tcbbox]"Factorial of " is a
3 literal string.

```

In the previous Java program, `"Factorial of "` is a literal string.

The enclosing environment for `pygmented` and `includepygmented` can be changed with the option `boxing method`. For instance, here is a hello world program in C#, enclosed in a `tcolorbox` environment:

```

1 \begin{pygmented}[lang=csharp,boxing method=tcolorbox]
2 using System;
3 class Program
4 {
5     public static void Main(string[] args)
6     {
7         Console.WriteLine("Hello, world!");
8     }
9 }
10 \end{pygmented}

```

```

using System;
class Program
{
    public static void Main(string[] args)
    {
        Console.WriteLine("Hello, world!");
    }
}

```

Any option unknown to `PygmenTEX` are passed to the enclosing command or environment.

For instance:

```

1 \begin{pygmented}[lang=xml,boxing method=tcolorbox,colframe=red,boxrule=2mm]
2 <!-- This is a note -->
3 <note>
4   <to>Tove</to>
5   <from>Jani</from>
6   <heading>Reminder</heading>
7   <body>Don't forget me this weekend!</body>
8 </note>
9 \end{pygmented}

```

```

<!-- This is a note -->
<note>
  <to>Tove</to>
  <from>Jani</from>
  <heading>Reminder</heading>
  <body>Don't forget me this weekend!</body>

```

</note>

12 Setting global options for PygmenT_EX

Global options can be setting using the `setpygmented` command. See the examples that follows.

```
1 \setpygmented{lang=haskell, colback=red!30, font=\ttfamily\small}
2
3 \begin{pygmented}{}
4 sum :: Num a => [a] -> a
5 sum [] = 0
6 sum (x:xs) = x + sum xs
7 \end{pygmented}
```

```
sum :: Num a => [a] -> a
sum [] = 0
sum (x:xs) = x + sum xs
```

```
1 \begin{pygmented}{colback=blue!20, boxing method=tcolorbox}
2 elem :: Eq a => a -> [a] -> Bool
3 elem _ [] = False
4 elem x (y:ys) = x == y || elem x ys
5 \end{pygmented}
```

```
elem :: Eq a => a -> [a] -> Bool
elem _ [] = False
elem x (y:ys) = x == y || elem x ys
```

```
1 \setpygmented{lang=snobol}
2
3 \begin{pygmented}{}
4 OUTPUT = "What is your name?"
5 Username = INPUT
6 OUTPUT = "Thank you, " Username
7 END
8 \end{pygmented}
```

```
OUTPUT = "What is your name?"
Username = INPUT
OUTPUT = "Thank you, " Username
END
```

```
1 \setpygmented{test/.style={colback=yellow!33,boxing method=tcolorbox,colframe=blue}}
2
3 \begin{pygmented}{test, lang=vbnet}
4 Module Module1
5 Sub Main()
6 Console.WriteLine("Hello, world!")
7 End Sub
8 End Module
9 \end{pygmented}
```

```
Module Module1
  Sub Main()
    Console.WriteLine("Hello, world!")
  End Sub
End Module
```

```
1 \begin{pygmented}{lang=tcl}
2 puts "Hello, world!"
3 \end{pygmented}
```

```
puts "Hello, world!"
```

13 More examples of inline code snippets

```
1 An inline source code snippet:
2 \pyginline[lang=c]|const double alfa = 3.14159;|.
3 This is a C declaration with initialization.
```

An inline source code snippet: `const double alfa = 3.14159;|. This is a C declaration with initialization.`

```
1 \pyginline[lang=prolog,colback=yellow]=avo(A,B) :- pai(A,X), pai(X,B).=
2 is a Prolog clause. Its head is
3 \pyginline[lang=prolog,sty=emacs,colback=yellow,linecolor=red]=avo(A,B)=
4 and its body is
5 \pyginline[lang=prolog,sty=vim,colback=black,hidealllines]=pai(A,X), pai(X,B)=.
```

`avo(A,B) :- pai(A,X), pai(X,B).` is a Prolog clause. Its head is `avo(A,B)` and its body is `pai(A,X), pai(X,B).`

```
1 See the identifier \pyginline[inline method=efbox,colback=green!25]|variable|,
2 which names something. String literals in C looks like
3 \pyginline[lang=c,inline method=tcbox,colback=blue!20,boxrule=2pt]!"hello, world!\n"|.
```

See the identifier `variable`, which names something. String literals in C looks like `"hello, world!\n"`.

```
1 This one
2 \pyginline[lang=ocaml,font=\ttfamily\scriptsize,topline=false]:let x = [1;2;3] in length x:
3 is an OCaml expression with local bindings. With OCaml one can do
4 imperative, functional and object oriented programming.
```

This one `let x = [1;2;3] in length x` is an OCaml expression with local bindings. With OCaml one can do imperative, functional and object oriented programming.

```
1 Now some Java code:
2 \pyginline[lang=java,sty=colorful,font=\ttfamily\itshape,linewidth=1pt]|public int f(double x)|.
3 This is a method header.
```

Now some Java code: `public int f(double x)`. This is a method header.

14 More examples of displayed code snippets

In listing ?? you can see a function definition in the Scheme language. This function computes the factorial of a natural number.

```
1 (define fact
2   (lambda (n)
3     (if (= n 0)
4         1
5         (* n (fact (- n 1))))))
```

Here you have some more code to further testing the package. Listing ?? is a Haskell program. When run this program interacts with the user asking the user name, reading a line input by the user, and showing a greeting message to the user.

Listagem 1: *A haskell interactive program*

```
79831 module Main where
79832
79833 - the main IO action
79834 main = do { putStr "What is your name? "
79835             , name'' <- read
79836             , putStrLn ("Hello, " ++ name'')}
79837 }
```

This is a rule:

Now a Pascal procedure:

```
procedure example(a: integer);
const
  A = 'jeja';
var
  sMessage: string;
begin
  ShowMessage(sMessage + A);
end;
```

and a Pascal program

```

5801 Program HelloWorld(output)
5802 var
5803     msg : String
5804 begin
5805     msg = 'Hello, world!';
5806     Writeln(msg)
5807 end.

```

A Python code snippet:

```

1  # -*- coding: utf-8 -*-
2
3  def parse_opts(dic, opts):
4      for opt in re.split(r'\s*,\s*', opts):
5          x = re.split(r'\s*=\s*', opt)
6          if len(x) == 2 and x[0] and x[1]:
7              dic[x[0]] = x[1]
8          elif len(x) == 1 and x[0]:
9              dic[x[0]] = True
10     return dic

```

15 Using code snippets in environments

The following is a **description** environment.

An item Sed consequat tellus et tortor. Ut tempor laoreet quam. Nullam id wisi a libero tristique semper. Nullam nisl massa, rutrum ut, egestas semper, mollis id, leo. Nulla ac massa eu risus blandit mattis. Mauris ut nunc. In hac habitasse platea dictumst. Aliquam eget tortor. Quisque dapibus pede in erat. Nunc enim. In dui nulla, commodo at, consectetur nec, malesuada nec, elit. Aliquam ornare tellus eu urna. Sed nec metus. Cum sociis natoque penatibus et magnis dis parturient montes, nascetur ridiculus mus. Pellentesque habitant morbi tristique senectus et netus et malesuada fames ac turpis egestas.

```

def qsort(xs: List[Int]): List[Int] =
  xs match {
    case Nil =>
      Nil
    case pivot :: tail =>
      qsort(tail filter { _ < pivot }) ::
        pivot :: qsort(tail filter { _ >= pivot })
  }

```

Phasellus id magna. Duis malesuada interdum arcu. Integer metus. Morbi pulvinar pellentesque mi. Suspendisse sed est eu magna molestie egestas. Quisque mi lorem, pulvinar eget, egestas quis, luctus at, ante. Proin auctor vehicula purus. Fusce ac nisl aliquam ante hendrerit pellentesque. Class

Fusce sed pede sit amet elit rhoncus ultrices. Nullam at enim vitae pede vehicula iaculis.

16 A long program

Here you can read the source code for a hand written lexical analyser for the *straight-line* programming language that I have developed in Java.

Ad hoc lexical analyser

```
import java.io.IOException;
import java.io.Reader;
import java.util.Hashtable;
import java.util.Map;

public class Lexer
{
  private Reader in;
  private int x;

  private Map<String,Token.T> reserved =
    new Hashtable<String,Token.T>();

  public Lexer(Reader in) throws IOException
  {
```

```

        this.in = in;
        x = in.read();
        reserved.put("let", Token.T.LET);
        // acrescentar demais palavras reservadas
        // ...
    }

    public Token get() throws IOException
    {
        // retornar o próximo símbolo léxico do programa

        while (Character.isWhitespace(x))
            x = in.read();

        if (x == -1)
            return new Token(Token.T.EOF);

        if ((char)x == ',')
        {
            x = in.read();
            return new Token(Token.T.COMMA);
        }

        if (Character.isDigit(x))
        {
            StringBuilder builder = new StringBuilder();
            builder.append((char)x);
            while (Character.isDigit((x = in.read())))
                builder.append((char)x);
            return new Token(Token.T.INT, new Long(builder.toString()));
        }

        if (Character.isAlphabetic(x))
        {
            StringBuilder builder = new StringBuilder();
            builder.append((char)x);
            while (Character.isAlphabetic(x = in.read()) ||
                Character.isDigit(x) || (char)x == '_' || (char)x == '$')
                builder.append((char)x);
            String s = builder.toString();
            Token.T t = reserved.get(s);
            if (t == null)
                return new Token(Token.T.ID, s);
            return new Token(t);
        }

        // completar demais tokens

        System.out.println("unexpected char: <" + (char)x + ">");
        x = in.read();
        return get();
    }
}

```

17 Some fancy examples using tcolorbox

The followig example uses tcolorbox to typeset the code listing.

```
object HelloWorld extends App {  
  println("Hello, world!")  
}
```

```
public class Hello {  
  public static void main(String[] args) {  
    System.out.println("Hello, world!")  
  }  
}
```

```
module Main (main) where  
  
main :: IO ()  
main = putStrLn "Hello, world!"
```

```
#include <iostream>  
using namespace std;  
int main(int argc, char** argv) {  
  cout << "Hello, world!" << endl;  
  return 0;  
}
```

```
/* This program prints a  
   hello world message  
   to the console. */  
  
import std.stdio;  
  
void main()  
{  
  writeln("Hello, World!");  
}
```

18 Some fancy examples using mdframed

The followig example uses mdframed to typeset the code listing.

```
with Ada.Text_IO;  
  
procedure Hello_World is  
  use Ada.Text_IO;  
begin
```

```
    Put_Line("Hello, world!");  
end;
```

```
program HelloWorld;  
  
begin  
    WriteLn('Hello, world!');  
end.
```

```
MODULE Hello;  
FROM STextIO IMPORT WriteString;  
BEGIN  
    WriteString("Hello World!");  
END Hello.
```

```
// hello world in 'go'  
package main  
  
import "fmt"  
  
func main() {  
    fmt.Println("Hello, world!")  
}
```

```
/* hello from objective-c */  
  
#import <stdio.h>  
#import <Foundation/Foundation.h>  
  
int main(void)  
{  
    NSLog(@"Hello, world!\n");  
    return 0;  
}
```

```
#include <stdio.h>  
int main(int argc, char **argv) {  
    printf("Hello, world!\n");  
    return 0;  
}
```

19 Conclusion

That is all.
