

`coder` — code inlined in a \LaTeX document*

Jérôme LAURENS[†]

Released 2022/02/07

Abstract

Usually, documentation is put inside the code, `coder` allows to work the other way round by putting code inside the documentation. This is particularly interesting when different code files share some logic and should be documented all at once. The file `coder-manual.pdf` gives different examples. Here is the implementation of the package.

This \LaTeX package requires $\text{Lua}\text{\TeX}$ and may use syntax coloring based on the `pygments`¹ package.

1 Package dependencies

`datetime2`, `xcolor`, `fancyvrb` and dependencies of these packages.

2 Similar technologies

The `docstrip` utility offers similar features, it is on some respect more powerful than `coder` at the cost of more technicality and less practicality,

The `ydoc.cls` and `skdoc.cls` are full document classes with similar features but many more that are unrelated. `coder` focuses on code inlining and interfaces very well with `pygments` for a smart and efficient syntax highlighting.

The `pygmentex` and `minted` packages were somehow a source of inspiration.

3 Known bugs and limitations

- `coder` does not play well with `docstrip`.
- `coder` exportation does not play well with `beamer`.

*This file describes version 1.0a, last revised 2022/02/07.

[†]E-mail: jerome.laurens@u-bourgogne.fr

¹The `coder` package has been tested with `pygments` version 2.11.2

4 Presentation

`coder` is a triptych of three complementary components

1. `coder.sty`, on the \LaTeX side,
2. `coder-util.lua`, to manage some data and call `coder-tool.py`,
3. `coder-tool.py`, to color code with the help of `pygments`.

`coder.sty` mainly declares the `\CDRCode` command and the `CDRBlock` environment. The former allows to insert code chunks as running text whereas the latter allows to insert code snippets as blocks. Moreover, block code chunks can be exported to files, once declared with `\CDRExport` command. The `\CDRSet` command is used to set various parameters, including display engines declared with either `\CDRCodeEngineNew` or `\CDRBlockEngineNew`².

4.1 Code flow

The normal code flow is

1. from `coder.sty`, \LaTeX parses a code snippet as `\CDRCode` argument of `CDRBlock` environment body, somehow stores it, and calls `CDR:highlight_source`,
2. `coder-util.lua` reads the content of some command, and stores it in a `json` file, together with informations to process this code snippet properly,
3. `coder-tool.py` is then asked by `coder-util.lua` to read the `json` file and eventually uses `pygments` to translate the code snippet into dedicated \LaTeX coloring commands. These are stored in a `*.pyg.tex` file named after the md5 digest of the original code chunk, a `*.pyg.sty` \LaTeX style file is recorded as well. On return, `coder.sty` is able to input both the `*.pyg.sty` and the `*.pyg.tex` file, which are finally executed and the code is displayed with colors. `coder-tool.py` is also partially responsible of code line numbering in conjunction with `coder.sty`.

The package `coder.sty` only exchanges with `coder-util.lua` using `\directlua`, `tex.print` and `token.get_macro`. `coder-tool.py` in turn only exchanges with `coder-util.lua`: we put in `coder-tool.py` as few \LaTeX logic as possible. It receives instructions from `coder.sty` as command line arguments, \LaTeX options, `pygments` options and `fancyvrb` options.

4.2 File exportation

1. The `\CDRExport` command declares a file path, a list of tags and other useful informations like a coding language. These data are saved as export records by `coder-util.lua`.
2. When some `tags={...}` have been given to the `CDRBlock` environment, the `coder-util.lua` records the corresponding code chunk and its associate tags for later save.
3. Once the typesetting process is complete, `coder-util.lua`'s `CDR_export_...` methods are called to save all the files externally. For each export record, `coder-util.lua` collects all the chunks with the same tag and save them at the proper location.

²Work in progress

4.3 Display engine

The display management is partly delegated to other packages. `coder.sty` provides default engines for running code and code blocks, and new engines can be declared with `\CDRCODEENGINENew` and `\CDRBlockENGINENew`.

4.4 L^AT_EX user interface

The first required argument of both commands and environment is a `<key[=value] controls>` list managed by `l3keys`. Each command requires its own `l3keys` module but some `<key[=value] controls>` are shared between modules.

4.5 Properties and inheritance

Properties cover various informations, from the language of the code, to the color and font. They are uniquely identified by a path component, the *tag*, which is used for inheritance. All tags starting with two leading underscore characters are reserved by the package. Other tags are at the user disposal.

Each processed code chunk has a list of associate tags. Most tag inherits from default ones.

5 Namespace and conventions

L^AT_EX identifiers related to `coder` start with `CDR`, including both commands and environment. `expl3` identifiers also start with `CDR`, after and eventual leading `c_`, `l_` or `g_`. `l3keys` module path's first component is either `CDR` or starts with `CDR@`.

`lua` objects (functions and variables) are collected in the `CDR` table automatically created while loading `coder-util.lua` from `coder.sty`.

The `c` argument specifier is used here in a more general acception. Normally, it means that the argument is turned to a command sequence name. Here, it means that the argument is part of something bigger which is turned to a command sequence name. As such, there is no need to explicitly expand such an argument.

6 Options

Key-value options allow the user, `coder.sty`, `coder-util.lua` and `coder-tool.py` to exchange data. What the user is allowed to do is illustrated in [coder-manual.pdf](#).

6.1 fancyvrb

These are `fancyvrb` options verbatim. The `fancyvrb` manual has more details, only some parts are reproduced hereafter. All of these options may not be relevant for all situations. Some of them make no sense in `code` mode, whereas others may not be compatible with the display engine.

- **formatcom**=`<command>` execute before printing verbatim text. Initially empty. Ignored in `code` mode.
- **fontfamily**=`<family name>` font family to use. `tt`, `courier` and `helvetica` are pre-defined. Initially `tt`.

- **fontsize**= \langle *font size* \rangle size of the font to use. If you use the **relsize** package as well, you can require a change of the size proportional to the current one (for instance: **fontsize**=**\relsize**{-2}). Initially **auto**: the same as the current font.
- **fontshape**= \langle *font shape* \rangle font shape to use. Initially **auto**: the same as the current font.
- **showspaces**[=**true**|**false**] print a special character representing each space. Initially **false**: spaces not shown.
- **showtabs**=**true**|**false** explicitly show tab characters. Initially **false**: tab characters not shown.
- **obeytabs**=**true**|**false** position characters according to the tabs. Initially **false**: tab characters are added to the current position.
- **tabsize**= \langle *integer* \rangle number of spaces given by a tab character, Initially 2 (8 for **fancyvrb**).
- **defineactive**= \langle *macro* \rangle to define the effect of active characters. This allows to do some devious tricks, see the **fancyvrb** package. Initially empty.
- ✓ **relabel**= \langle *label* \rangle define a label to be used with **\pageref**. Initially empty.
- **commentchar**= \langle *character* \rangle lines starting with this character are ignored. Initially empty.
- **gobble**= \langle *integer* \rangle number of characters to suppress at the beginning of each line (from 0 to 9), mainly useful when environments are indented. Only **block** mode.
- **frame**=**none**|**leftline**|**topline**|**bottomline**|**lines**|**single** type of frame around the verbatim environment. With **leftline** and **single** modes, a space of a length given by the L^AT_EX **\fboxsep** macro is added between the left vertical line and the text. Initially **none**: no frame.
- **label**= $\{$ [\langle *top string* \rangle] \langle *string* \rangle $\}$ label(s) to print on top, bottom or both, frame lines. If the label(s) contains special characters, comma or equal sign, it must be placed inside a group. If an optional \langle *top string* \rangle is given between square brackets, it will be used for the top line and \langle *string* \rangle for the bottom line. Otherwise, \langle *string* \rangle is used for both the top or bottom lines. Label(s) are printed only if the **frame** parameter is one of **topline**, **bottomline**, **lines** or **single**. Initially empty: no label.
- **labelposition**=**none**|**topline**|**bottomline**|**all** position where to print the label(s) when defined. When options happen to be contradictory, like **frame**=**topline** and **labelposition**=**bottomline**, nothing is displayed. Initially **none** when no labels are defined, **topline** for one label and **all** otherwise.
- **numbers**=**none**|**left**|**right** numbering of the verbatim lines. If requested, this numbering is done outside the verbatim environment. Initially **none**: no numbering.
- **numbersep**= \langle *dimension* \rangle gap between numbers and verbatim lines. Initially 12pt.

- **firstnumber=auto|last| \langle integer \rangle** number of the first line. **last** means that the numbering is continued from the previous verbatim environment. If an integer is given, its value will be used to start the numbering. Initially **auto**: numbering starts from 1.
- **stepnumber= \langle integer \rangle** interval at which line numbers are printed. Initially 1: all lines are numbered.
- **numberblanklines[=true|false]** to number or not the white lines (really empty or containing blank characters only). Initially **true**: all lines are numbered.
- **firstline= \langle integer \rangle | \langle regular expression \rangle** first line to print, relative to the block. Initially empty: all lines from the first are printed.
- **lastline= \langle integer \rangle | \langle regular expression \rangle** last line to print, relative to the block. Initially empty: all lines until the last one are printed.
- **baselinestretch=auto| \langle dimension \rangle** value to give to the usual `\baselinestretch` L^AT_EX parameter. Initially **auto**: its current value just before the verbatim command.
- ⊘ **commandchars= \langle three characters \rangle** characters which define the character which starts a macro and marks the beginning and end of a group; thus lets us introduce escape sequences in verbatim code. Of course, it is better to choose special characters which are not used in the verbatim text. Private to **coder**, unavailable to users.
- **xleftmargin= \langle dimension \rangle** indentation to add at the start of each line. Initially **0pt**: no left margin.
- **xrightmargin= \langle dimension \rangle** right margin to add after each line. Initially **0pt**: no right margin.
- **resetmargins[=true|false]** reset the left margin, which is useful if we are inside other indented environments. Initially **true**.
- **hfuzz= \langle dimension \rangle** value to give to the T_EX `\hfuzz` dimension for text to format. This can be used to avoid seeing some unimportant overfull box messages. Initially **2pt**.
- **samepage[=true|false]** in very special circumstances, we may want to make sure that a verbatim environment is not broken, even if it does not fit on the current page. To avoid a page break, we can set the **samepage** parameter to **true**. Initially **false**.

6.2 pygments options

These are **pygments**'s `LatexFormatter` options, used only by `coder-util.lua` to communicate with `coder-tool.py`.

- **style= \langle name \rangle** the **pygments** style to use. Initially **default**.
- ⊘ **full** Tells the formatter to output a **full** document, i.e. a complete self-contained document (default: **false**). Forbidden.
- ⊘ **title** If **full** is true, the title that should be used to caption the document (default empty). Forbidden.

- ⊘ **encoding** If given, must be an encoding name. This will be used to convert the Unicode token strings to byte strings in the output. If it is `or None`, Unicode strings will be written to the output file, which most file-like objects do not support (default: `None`).
- ⊘ **outencoding** Overrides **encoding** if given.
- ⊘ **docclass** If the **full** option is enabled, this is the document class to use (default: `article`). Forbidden.
- ⊘ **preamble** If the **full** option is enabled, this can be further preamble commands, e.g. `"\usepackage"` (default `empty`). Forbidden.
- ⊘ **linenos**`[=true|false]` If set to `true`, output line numbers. Initially `false`: no numbering. Ignored in `code` mode.
- ⊘ **linenostart**`=<integer>` The line number for the first line. Initially 1: numbering starts from 1. Ignored in `code` mode.
- ⊘ **linenostep**`=<integer>` If set to a number $n > 1$, only every n th line number is printed. Ignored in `code` mode. Additional options given to the `Verbatim` environment (see the `fancyvrb` docs for possible values). Initially `empty`.
- ⊘ **verboptions** Forbidden.
- **commandprefix**`=<text>` The LaTeX commands used to produce colored output are constructed using this prefix and some letters. Initially `PY`.
- **texcomments**`[=true|false]` If set to `true`, enables LaTeX comment lines. That is, LaTeX markup in comment tokens is not escaped so that LaTeX can render it. Initially `false`. Ignored in `code` mode.
- **mathescape**`[=true|false]` If set to `true`, enables LaTeX math mode escape in comments. That is, `$...$` inside a comment will trigger math mode. Initially `false`.
- **escapeinside**`=<before><after>` If set to a string of length 2, enables escaping to LaTeX. Text delimited by these 2 characters is read as LaTeX code and typeset accordingly. It has no effect in string literals. It has no effect in comments if **texcomments** or **mathescape** is set. The character cannot be a caret `^`. Initially `empty`.
- ⚙ **envname**`=<name>` Allows you to pick an alternative environment name replacing `Verbatim`. The alternate environment still has to support `Verbatim`'s option syntax. Initially `Verbatim`.

6.3 LaTeX

These are options used by `coder.sty` to pass data to `coder-tool.py`. All values are required, possibly empty.

- **tags** `clist` of tag names, used for line numbering.
- **inline** `true` when inline code is concerned, `false` otherwise.
- **sty_template** LaTeX source text where `<placeholder:style_defs>` must be replaced by the style definitions provided by `pygments`. It may include the style name.

All the line templates below are L^AT_EX source text where `<placeholder:number>` should be replaced by a line number and `<placeholder:line>` should be replaced by the highlighted line code provided by `pygments`. They should not include a trailing newline char.

File I

coder-util.lua implementation

1 Usage

This lua library is loaded by `coder.sty` with the instruction `CDR=require(coder-util)`. In the sequel, the syntax to call class methods and instance methods are presented with either a `CDR.` or a `CDR:` prefix. This is what is used in the library for convenience. Of course either a `self.` or a `self:` prefix would be possible.

2 Declarations

```

1 %<*lua>
2 local lfs    = _ENV.lfs
3 local tex    = _ENV.tex
4 local token  = _ENV.token
5 local md5    = _ENV.md5
6 local kpse   = _ENV.kpse
7 local rep    = string.rep
8 local lpeg   = require("lpeg")
9 local P, Cg, Cp, V = lpeg.P, lpeg.Cg, lpeg.Cp, lpeg.V
10 local json  = require('lualibs-util-jsn')
```

3 General purpose material

`CDR_PY_PATH` Location of the `coder-tool.py` utility. This will cause an error if `kpsewhich` is not available. The PATH must be properly set up.

```
11 local CDR_PY_PATH = kpse.find_file('coder-tool.py')
```

(End definition for CDR_PY_PATH. This variable is documented on page ??.)

`set_python_path` `CDR:set_python_path(<path var>)`

Manually set the path of the `python` utility with the contents of the `<path var>`. If the given path does not point to a file or a link then an error is raised. On return, print `true` or `false` in the T_EX stream to indicate whether `pygments` is available.

```

12 local function set_python_path(self, path_var)
13   local path, mode, __, __
14   if path_var then
15     path = assert(token.get_macro(path_var))
16     mode, __, __ = lfs.attributes(path, 'mode')
17     print('**** CDR mode', path, mode)
18   end
```

```

19  if not mode then
20      path = io.popen([[which python]]):read('a'):match("^%s*(.-%s*$")
21      mode,_,_ = lfs.attributes(path,'mode')
22      print('**** CDR mode', path, mode)
23  end
24  if mode == 'file' or mode == 'link' then
25      self.PYTHON_PATH = path
26      print('**** CDR python path', self.PYTHON_PATH)
27      path = path:match("^(./+)"..'.pygmentize'
28      mode,_,_ = lfs.attributes(path,'mode')
29      print('**** CDR path, mode', path, mode)
30      if mode == 'file' or mode == 'link' then
31          tex.print('true')
32      else
33          tex.print('false')
34      end
35  else
36      self.PYTHON_PATH = nil
37  end
38 end

```

JSON_boolean_true Special marker to encode booleans in JSON files. These are table which `__cls__` field is
JSON_boolean_false either BooleanTrue or BooleanFalse.

(End definition for JSON_boolean_true and JSON_boolean_false. These variables are documented on page ??.)

```

39 local JSON_boolean_true = {
40     __cls__ = 'BooleanTrue',
41 }
42 local JSON_boolean_false = {
43     __cls__ = 'BooleanFalse',
44 }

```

is_truthy if is_truthy(*<what>*) then
<true code>
else
<false code>
end

Execute *<true code>* if *<what>* is JSON_boolean_true or the string "true", *<false code>* otherwise. Upvalue for the clients.

```

45 local function is_truthy(s)
46     return s == JSON_boolean_true or s == 'true'
47 end

```

escape *<variable>* = CDR.escape(*<string>*)

 Escape the given string to be used by the shell.

```

48 local function escape(s)
49     s = s:gsub(' ', '\\ ')
50     s = s:gsub('\\', '\\\\')

```

```

51 s = s.gsub('\r','\\r')
52 s = s.gsub('\n','\\n')
53 s = s.gsub("'",'\\\'')
54 s = s.gsub('"','\\"')
55 return s
56 end

```

make_directory $\langle\text{variable}\rangle = \text{CDR.make_directory}(\langle\text{string path}\rangle)$

Make a directory at the given path.

```

57 local function make_directory(path)
58   local mode,_,_ = lfs.attributes(path,"mode")
59   if mode == "directory" then
60     return true
61   elseif mode ~= nil then
62     return nil,path.." exist and is not a directory",1
63   end
64   if os["type"] == "windows" then
65     path = path.gsub("/", "\\")
66     _,_,_ = os.execute(
67       "if not exist " .. path .. "\\nul " .. "mkdir " .. path
68     )
69   else
70     _,_,_ = os.execute("mkdir -p " .. path)
71   end
72   mode = lfs.attributes(path,"mode")
73   if mode == "directory" then
74     return true
75   end
76   return nil,path.." exist and is not a directory",1
77 end

```

dir_p The directory where the auxiliary pygments related files are saved, in general $\langle\text{jobname}\rangle.\text{pygd}/$.

(End definition for dir_p. This variable is documented on page ??.)

json_p The path of the JSON file used to communicate with coder-tool.py, in general $\langle\text{jobname}\rangle.\text{pygd}/\langle\text{jobname}\rangle.\text{pyg.json}$.

(End definition for json_p. This variable is documented on page ??.)

```

78 local dir_p, json_p
79 local jobname = tex.jobname
80 dir_p = './..jobname..'.pygd/'
81 if make_directory(dir_p) == nil then
82   dir_p = './'
83   json_p = dir_p..jobname..'.pyg.json'
84 else
85   json_p = dir_p..'input.pyg.json'
86 end

```

safe_equals $\langle\text{variable}\rangle = \text{safe_equals}(\langle\text{string}\rangle)$

Class method. Returns an $\langle\text{...}\rangle$ string as $\langle\text{ans}\rangle$ exactly composed of sufficiently many = signs such that $\langle\text{string}\rangle$ contains neither sequence $[\langle\text{ans}\rangle[\text{ nor }]\langle\text{ans}\rangle]$.

```

87 local eq_pattern = P({ Cp() * P('=')^1 * Cp() + P(1) * V(1) })
88 local function safe_equals(s)
89   local i, j = 0, 0
90   local max = 0
91   while true do
92     i, j = eq_pattern:match(s, j)
93     if i == nil then
94       return rep('=', max + 1)
95     end
96     i = j - i
97     if i > max then
98       max = i
99     end
100   end
101 end

```

load_exec CDR:load_exec(*lua code chunk*)

Class method. Loads the given *lua code chunk* and execute it. On error, messages are printed.

```

102 local function load_exec(self, chunk)
103   local env = setmetatable({ self = self, tex = tex }, _ENV)
104   local func, err = load(chunk, 'coder-tool', 't', env)
105   if func then
106     local ok
107     ok, err = pcall(func)
108     if not ok then
109       print("coder-util.lua Execution error:", err)
110       print('chunk:', chunk)
111     end
112   else
113     print("coder-util.lua Compilation error:", err)
114     print('chunk:', chunk)
115   end
116 end

```

load_exec_output CDR:load_exec_output(*lua code chunk*)

Instance method to parse the *lua code chunk* string for commands and execute them. The patterns being searched are enclosed within opening <<<<< and closing >>>>>, each containing 5 characters,

?TEX:*TeX instructions* the *TeX instructions* are executed asynchronously once the control comes back to T_EX.

!LUA:*!Lua instructions* the *!Lua instructions* are executed synchronously. When not properly designed, these instruction may cause a forever loop on execution, for example, they must not use CDR:if_code_ngn.

?LUA:*?Lua instructions* these *?Lua instructions* are executed asynchronously once the control comes back to T_EX through a call to \directlua, which means that they will wait until any previous asynchronous *?TeX instructions* or *?Lua instructions* completes.

```

117 local parse_pattern
118 do
119     local tag = P('!'') + '*' + '?'
120     local stp = '>>>>'
121     local cmd = (P(1) - stp)^0
122     parse_pattern = P({
123         P('<<<<') * Cg(tag) * 'LUA:' * Cg(cmd) * stp * Cp() + 1 * V(1)
124     })
125 end
126 local function load_exec_output(self, s)
127     local i, tag, cmd
128     i = 1
129     while true do
130         tag, cmd, i = parse_pattern:match(s, i)
131         if tag == '!' then
132             self:load_exec(cmd)
133         elseif tag == '*' then
134             local eqs = safe_equals(cmd)
135             cmd = '[' .. eqs .. '[' .. cmd .. ']' .. eqs .. ']'
136             tex.print([[
137 \directlua{CDR:load_exec[]..cmd..[]}%
138 ]])
139         elseif tag == '?' then
140             print('\nDEBUG/coder: ' .. cmd)
141         else
142             return
143         end
144     end
145 end

```

4 Variables

BooleanTrue Boolean variables.

BooleanFalse *(End definition for BooleanTrue and BooleanFalse. These variables are documented on page ??.)*

```

146 local BooleanTrue = {
147     __cls__ = 'BooleanTrue'
148 }
149 local BooleanFalse = {
150     __cls__ = 'BooleanFalse'
151 }

```

5 Hiligting

5.1 Common

highlight_set CDR:highlight_set(...)

Highlight the currently entered block. Build a configuration table with all data necessary for the processing, save it as a JSON file and launch `coder-tool.py` with the proper arguments.

```

152 local function highlight_set(self, key, value)
153   local args = self['.arguments']
154   local t = args
155   if t[key] == nil then
156     t = args.pygopts
157     if t[key] == nil then
158       t = args.texopts
159       if t[key] == nil then
160         t = args.fv_opts
161         assert(t[key] ~= nil)
162       end
163     end
164   end
165   if t[key] == JSON_boolean_true or t[key] == JSON_boolean_false then
166     t[key] = value == 'true' and JSON_boolean_true or JSON_boolean_false
167   else
168     t[key] = value
169   end
170 end
171
172 local function highlight_set_var(self, key, var)
173   self:highlight_set(key, assert(token.get_macro(var or 'l_CDR_t1')))
174 end

```

highlight_source CDR:highlight_source(*<src>*, *<sty>*)

Highlight the currently entered block if *<src>* is **true**, build the style definitions if *<sty>* is **true**. Build a configuration table with all data necessary for the processing, save it as a JSON file and launch `coder-tool.py` with the proper arguments. Set the `\l_CDR_pyg_sty_t1` and `\l_CDR_pyg_tex_t1` macros on return, depending on *<src>* and *<sty>*.

```

175 local function highlight_source(self, sty, src)
176   if not self.PYTHON_PATH then
177     return
178   end
179   local args = self['.arguments']
180   local texopts = args.texopts

392             code = code
393         }
394         for tag in self['.tags clist']:gmatch('([^\,]+)') do
395             local tt = records[tag] or {}
396             records[tag] = tt
397             tt[#tt+1] = t
398         end
399     end
400     self:synctex_state_restore()
401 end

```

6 Exportation

For each file to be exported, `coder.sty` calls `export_file` to initialize the exportation. Then it calls `export_file_info` to share the `tags`, `raw`, `preamble`, `postamble` data. Finally, `export_complete` is called to complete the exportation.

export_file CDR:export_file(*<file name var>*)

This is called at export time. *<file name var>* is the name of an str variable containing the file name.

```
402 local function export_file(self, file_name_var)
403   self['.name'] = assert(token.get_macro(assert(file_name_var)))
404   self['.export'] = {
405     preamble = {},
406     postamble = {},
407   }
408 end
```

export_file_info CDR:export_file_info(*<key>*, *<value name var>*)
append_file_info CDR:append_file_info(*<key>*, *<value name var>*)

This is called at export time. *<value name var>* is the name of an str variable containing the value.

```
409 local function export_file_info(self, key, value)
410   local export = self['.export']
411   value = assert(token.get_macro(assert(value)))
412   if export[key] == BooleanTrue or export[key] == BooleanFalse then
413     export[key] = (value == 'true') and BooleanTrue or BooleanFalse
414   else
415     export[key] = value
416   end
417 end
418 local function append_file_info(self, key, value)
419   local export = self['.export']
420   local t = export[key]
421   value = assert(token.get_macro(assert(value)))
422   t[#t+1] = value
423 end
```

export_complete CDR:export_complete()

This is called at export time.

```
424 local function export_complete(self)
425   local name = self['.name']
426   print('**** CDR NAME', name)
427   local export = self['.export']
428   local records = self['.records']
429   local raw = export.raw == 'true'
430   local once = export.once == 'true'
431   local tags = export.tags
432   local tt = {}
433   local s, t, _
434   print('**** CDR', tags, raw, once)
435   if not raw then
436     s = export.preamble
437     for _,t in ipairs(s) do
438       tt[#tt+1] = t
```

```

439     end
440 end
441 for tag in string.gmatch(export.tags, '([^\,]+)') do
442     local Rs = records[tag]
443     if Rs then
444         for _,R in ipairs(Rs) do
445             if not R.already[name] or not once then
446                 tt[#tt+1] = R.code
447             end
448             if once then
449                 R.already[name] = true
450             end
451         end
452     end
453 end
454 if not raw then
455     s = export.postamble
456     for _,t in ipairs(s) do
457         tt[#tt+1] = t
458     end
459 end
460 print('**** CDR', name, #tt)
461 if #tt>0 then
462     if #tt[#tt] > 0 then
463         tt[#tt+1] = ''
464     end
465     local fh = assert(io.open(name,'w'))
466     fh:write(table.concat(tt, '\n'))
467     fh:close()
468 end
469 self['.name'] = nil
470 self['.export'] = nil
471 end

```

7 Caching

We save some computation time by pygmentizing files only when necessary. The `codertool.py` is expected to create a `*.pyg.sty` file for a style and a `*.pyg.tex` file for highlighted code. These files are cached during one whole L^AT_EX run and possibly between different L^AT_EX runs. Lua keeps track of both the style files created and highlighted code files created.

<code>cache_clean_all</code>	<code>CDR:cache_clean_all()</code>
<code>cache_record</code>	<code>CDR:cache_record(<i><style name.pyg.sty></i>, <i><digest.pyg.tex></i>)</code>
<code>cache_clean_unused</code>	<code>CDR:cache_clean_unused()</code>

Instance methods. `cache_clean_all` removes any file in the cache directory named `<jobname>.pygd`. This is automatically executed at the beginning of the document processing when there is no aux file. This can also be executed on demand with `\directlua{CDR:cache_clean_all()}`. The `cache_record` method stores both `<style name.pyg.sty>` and `<digest.pyg.tex>`. These are file names relative to the `<jobname>.pygd` directory. `cache_clean_unused` removes any file in the cache directory `<jobname>.pygd` except the ones that were previously recorded. This is executed at the end of the document processing.

```

472 local function cache_clean_all(self)
473     local to_remove = {}
474     for f in lfs.dir(self.dir_p) do
475         to_remove[f] = true
476     end
477     for k,_ in pairs(to_remove) do
478         os.remove(self.dir_p .. k)
479     end
480 end
481 local function cache_record(self, pyg_sty_p, pyg_tex_p)
482     if pyg_sty_p then
483         self['.style_set'] [pyg_sty_p] = true
484     end
485     if pyg_tex_p then
486         self['.colored_set'] [pyg_tex_p] = true
487     end
488 end
489 local function cache_clean_unused(self)
490     local to_remove = {}
491     for f in lfs.dir(self.dir_p) do
492         f = self.dir_p .. f
493         if not self['.style_set'][f] and not self['.colored_set'][f] then
494             to_remove[f] = true
495         end
496     end
497     for f,_ in pairs(to_remove) do
498         os.remove(f)
499     end
500 end

```

File II

`coder-tool.py` implementation

The standard header is managed specially because of the way `docstrip` automatically adds some header when extracting stuff from an archive. The next two lines are added by `docstrip` at the top of the preamble.

```
1 %<*py>
2 #! /usr/bin/env python3
3 # -*- coding: utf-8 -*-
4 %</py>
```

1 Usage

Run: `coder-tool.py -h`.

2 Header and global declarations

```
5 %<*py>
6 __version__ = '0.10'
7 __YEAR__ = '2022'
8 __docformat__ = 'restructuredtext'
9
10 import sys
11 import os

19 from pygments.util import ClassNotFound
```

3 Options classes

Object is used to turn a dictionary into a full fledged object. The real class is given by the `__cls__` key.

```
20 class BaseOpts(object):
21     def __init__(self, d={}):
22         for k, v in d.items():
23             setattr(self, k, v)
```

3.1 TeXOpts class

```
24 class TeXOpts(BaseOpts):
25     tags = ''
26     is_inline = True
27     pyg_sty_p = None
```

The templates are provided by `coder.sty`. The style template wraps the style definitions provided by `pygments`. It may include the style name

```
28 sty_template=r'''% !TeX root=...
29 \makeatletter
30 \CDR@StyleDefine{<placeholder:style_name>} {%
31   <placeholder:style_defs>}%
32 \makeatother'''
33 def __init__(self, *args, **kwargs):
34     super().__init__(*args, **kwargs)
35     self.pyg_sty_p = Path(self.pyg_sty_p or '')
```

3.2 PygOptsclass

`pygments` LaTeXFormatter options. Some of them may be deliberately unused. In particular, line numbering is governed by `fancyvrb` options. The description of these options is in a forthcoming section.

```

36 class PygOpts(BaseOpts):
37     style = 'default'
38     nobackground = False
39     linenos = False
40     linenostart = 1
41     linenostep = 1
42     commandprefix = 'Py'
43     texcomments = False
44     mathescape = False
45     escapeinside = ""
46     envname = 'Verbatim'
47     lang = 'tex'
48     def __init__(self, *args, **kwargs):
49         super().__init__(*args, **kwargs)
50         self.linenostart = abs(int(self.linenostart))
51         self.linenostep = abs(int(self.linenostep))

```

3.3 FVclass

```

52 class FVOpts(BaseOpts):
53     gobble = 0
54     tabsize = 4
55     linenosep = '0pt'
56     commentchar = ''
57     frame = 'none'
58     framerule = '0.4pt',
59     framesep = r'\fboxsep',
60     rulecolor = 'black',
61     fillcolor = '',
62     label = ''
63     labelposition = 'none'
64     numbers = 'left'
65     numbersep = '1ex'
66     firstnumber = 'auto'
67     stepnumber = 1
68     numberblanklines = True
69     firstline = ''
70     lastline = ''
71     baselinestretch = 'auto'
72     resetmargins = True
73     xleftmargin = '0pt'
74     xrightmargin = '0pt'
75     hfuzz = '2pt'
76     vspace = r'\topsep'
77     samepage = False
78     def __init__(self, *args, **kwargs):
79         super().__init__(*args, **kwargs)
80         self.gobble = abs(int(self.gobble))
81         self.tabsize = abs(int(self.tabsize))
82         if self.firstnumber != 'auto':
83             self.firstnumber = abs(int(self.firstnumber))
84         self.stepnumber = abs(int(self.stepnumber))

```

3.4 Argumentsclass

```

85 class Arguments(BaseOpts):
86     cache = False
87     debug = False
88     source = ""
89     style = "default"
90     json = ""
91     directory = "."
92     texopts = TeXOpts()
93     pygopts = PygOpts()
94     fv_opts = FVOpts()

```

4 Controller main class

```

95 class Controller:

```

4.1 Static methods

object_hook Helper for json parsing.

```

96     @staticmethod
97     def object_hook(d):
98         __cls__ = d.get('__cls__', 'Arguments')
99         if __cls__ == 'PygOpts':

101         elif __cls__ == 'FVOpts':
102             return FVOpts(d)
103         elif __cls__ == 'TeXOpts':
104             return TeXOpts(d)
105         elif __cls__ == 'BooleanTrue':
106             return True
107         elif __cls__ == 'BooleanFalse':
108             return False
109         else:
110             return Arguments(d)

```

lua_command lua_command_now lua_debug	self.lua_command(<i>(asynchronous lua command)</i>) self.lua_command_now(<i>(synchronous lua command)</i>)
--	---

Wraps the given command between markers. It will be in the output of the `coder-tool.py`, further captured by `coder-util.lua` and either forwarded to \TeX or executed synchronously.

```

111     @staticmethod
112     def lua_command(cmd):
113         print(f'<<<<<*LUA:{cmd}>>>>>')
114     @staticmethod
115     def lua_command_now(cmd):
116         print(f'<<<<<!LUA:{cmd}>>>>>')
117     @staticmethod
118     def lua_debug(msg):
119         print(f'<<<<<?LUA:{msg}>>>>>')

```

`lua_text_escape` `self.lua_text_escape(<text>)`

Wraps the given command between [=...=[and]=...=] with as many equal signs as necessary to ensure a correct lua syntax.

```
120 @staticmethod
121 def lua_text_escape(s):
122     k = 0
123     for m in re.findall('+=', s):
124         if len(m) > k: k = len(m)
125     k = (k + 1) * "="
126     return f'[{k}][{s}]{k}']
```

4.2 Computed properties

`self.json_p` The full path to the json file containing all the data used for the processing.

(End definition for self.json_p. This variable is documented on page ??.)

```
127 _json_p = None
128 @property
129 def json_p(self):
130     p = self._json_p
131     if p:
132         return p
133     else:
134         p = self.arguments.json
135         if p:
136             p = Path(p).resolve()
137         self._json_p = p
138     return p
```

`self.parser` The correctly set up `argparse` instance.

(End definition for self.parser. This variable is documented on page ??.)

```
139 @property
140 def parser(self):
141     parser = argparse.ArgumentParser(
142         prog=sys.argv[0],
143         description='',
144         Writes to the output file a set of LaTeX macros describing
145         the syntax highlighting of the input file as given by pygments.
146         ''',
147     )
148     parser.add_argument(
149         "-v", "--version",
150         help="Print the version and exit",

```

1 Setup

1.1 Utilities

`\CDR_set_conditional:Nn` `\CDR_set_conditional:Nn <core name> {<condition>}`

Wrapper over `\prg_set_conditional:Nnn`.

```
3 \cs_new:Npn \CDR_set_conditional:Nn #1 #2 {
4   \bool_if:nTF { #2 } {
5     \prg_set_conditional:Nnn #1 { p, T, F, TF } { \prg_return_true: }
6   } {
7     \prg_set_conditional:Nnn #1 { p, T, F, TF } { \prg_return_false: }
8   }
9 }
```

`\CDR_set_conditional_alt:Nn` `\CDR_set_conditional_alt:Nnn <core name> {<condition>}`

Wrapper over `\prg_set_conditional:Nnn`.

```
10 \cs_new:Npn \CDR_set_conditional_alt:Nn #1 #2 {
11   \prg_set_conditional:Nnn #1 { p, T, F, TF } {
12     \bool_if:nTF { #2 } { \prg_return_true: } { \prg_return_false: }
13   }
14 }
```

`\CDR_has_pygments_p: *` `\CDR_has_pygments:TF {<true code>} {<false code>}`

`\CDR_has_pygments:TF *` Execute `<true code>` when pygments is available, `<false code>` otherwise. *Implementation detail:* we define the conditionals to raise and set them later by a call to `\CDR_pygments_setup:n`.

```
15 \prg_new_conditional:Nnn \CDR_has_pygments: { p, T, F, TF } {
16   \PackageError { coder } { Internal~error(pygments-path) } { Please~report~error }
17 }
```

`\CDR_pygments_setup:n` `\CDR_pygments_setup:n {<boolean string>}`

Set up the conditional set `\CDR_has_pygments...` according to `<boolean string>`. When this string is `true`, then coder has pygments, it has not otherwise.

```
18 \cs_new:Npn \CDR_pygments_setup:n #1 {
19   \cs_undefine:N \CDR_has_pygments:T
20   \cs_undefine:N \CDR_has_pygments:F
21   \cs_undefine:N \CDR_has_pygments:TF
22   \cs_undefine:N \CDR_has_pygments_p:

64 }

```

3 Constants

`\c_CDR_tags` Paths of L3keys modules.

`\c_CDR_Tag` These are root path components used throughout the package. The latter is a subpath of the former.

```

65 \str_const:Nn \c_CDR_Tag { CDR@Tag }
66 \str_const:Nx \c_CDR_tags { \c_CDR_Tag / tags }

```

(End definition for `\c_CDR_tags` and `\c_CDR_Tag`. These variables are documented on page ??.)

`\c_CDR_tag_get` Root identifier for tag properties, used throughout the package.

```
67 \str_const:Nn \c_CDR_tag_get { CDR@tag@get }
```

(End definition for \c_CDR_tag_get. This variable is documented on page ??.)

4 Implementation details

As far as possible, macro making assignments to variables are protected. All variables following expl3 naming conventions are implementation details and therefore must be considered private.

Many functions have useful hooks for debugging or testing.

`\CDR@Debug` `{\argument}`

The default implementation just gobbles its argument. During development or testing, this may call `\typeout`.

```
68 \cs_new:Npn \CDR@Debug { \use_none:n }
```

5 Variables

5.1 Internal scratch variables

These local variables are used in a very limited scope.

`\l_CDR_bool` Local scratch variable.

```
69 \bool_new:N \l_CDR_bool
```

(End definition for \l_CDR_bool. This variable is documented on page ??.)

`\l_CDR_tl` Local scratch variable.

```
70 \tl_new:N \l_CDR_tl
```

(End definition for \l_CDR_tl. This variable is documented on page ??.)

`\l_CDR_str` Local scratch variable.

```
71 \str_new:N \l_CDR_str
```

(End definition for \l_CDR_str. This variable is documented on page ??.)

`\l_CDR_seq` Local scratch variable.

```
72 \seq_new:N \l_CDR_seq
```

(End definition for \l_CDR_seq. This variable is documented on page ??.)

`\l_CDR_prop` Local scratch variable.

```
73 \prop_new:N \l_CDR_prop
```

(End definition for \l_CDR_prop. This variable is documented on page ??.)

`\l_CDR_clist` The comma separated list of current chunks.

```
74 \clist_new:N \l_CDR_clist
```

(End definition for \l_CDR_clist. This variable is documented on page ??.)

5.2 Files

`\l_CDR_ior` Input file identifier

```
75 \ior_new:N \l_CDR_ior
```

(End definition for \l_CDR_ior. This variable is documented on page ??.)

`\l_CDR_iow` Output file identifier

```
76 \iow_new:N \l_CDR_iow
```

(End definition for \l_CDR_iow. This variable is documented on page ??.)

5.3 Global variables

Line number counter for the source code chunks.

`\g_CDR_source_int` Chunk number counter.

```
77 \int_new:N \g_CDR_source_int
```

(End definition for \g_CDR_source_int. This variable is documented on page ??.)

`\g_CDR_source_prop` Global source property list.

```
78 \prop_new:N \g_CDR_source_prop
```

(End definition for \g_CDR_source_prop. This variable is documented on page ??.)

`\g_CDR_chunks_tl` The comma separated list of current chunks. If the next list of chunks is the same as the
`\l_CDR_chunks_tl` current one, then it might not display.

```
79 \tl_new:N \g_CDR_chunks_tl
```

```
80 \tl_new:N \l_CDR_chunks_tl
```

(End definition for \g_CDR_chunks_tl and \l_CDR_chunks_tl. These variables are documented on page ??.)

`\g_CDR_vars` Tree storage for global variables.

```
81 \prop_new:N \g_CDR_vars
```

(End definition for \g_CDR_vars. This variable is documented on page ??.)

`\g_CDR_hook_tl` Hook general purpose.

```
82 \tl_new:N \g_CDR_hook_tl
```

(End definition for \g_CDR_hook_tl. This variable is documented on page ??.)

`\g/CDR/Chunks/<name>` List of chunk keys for given named code.

(End definition for \g/CDR/Chunks/<name>. This variable is documented on page ??.)

5.4 Local variables

`\l_CDR_kv_clist` keyval storage.

83 `\clist_new:N \l_CDR_kv_clist`

(End definition for \l_CDR_kv_clist. This variable is documented on page ??.)

`\l_CDR_opts_tl` options storage.

84 `\tl_new:N \l_CDR_opts_tl`

(End definition for \l_CDR_opts_tl. This variable is documented on page ??.)

`\l_CDR_recorded_tl` Full verbatim body of the CDR environment.

85 `\tl_new:N \l_CDR_recorded_tl`

(End definition for \l_CDR_recorded_tl. This variable is documented on page ??.)

`\l_CDR_count_tl` Contains the number of lines processed by `pygments` as tokens.

86 `\tl_new:N \l_CDR_count_tl`

(End definition for \l_CDR_count_tl. This variable is documented on page ??.)

`\g_CDR_int` Global integer to store linenos locally in time.

87 `\int_new:N \g_CDR_int`

(End definition for \g_CDR_int. This variable is documented on page ??.)

`\l_CDR_line_tl` Token list for one line.

88 `\tl_new:N \l_CDR_line_tl`

(End definition for \l_CDR_line_tl. This variable is documented on page ??.)

`\l_CDR_lineno_tl` Token list for lineno display.

89 `\tl_new:N \l_CDR_lineno_tl`

(End definition for \l_CDR_lineno_tl. This variable is documented on page ??.)

`\l_CDR_name_tl` Token list for chunk name display.

90 `\tl_new:N \l_CDR_name_tl`

(End definition for \l_CDR_name_tl. This variable is documented on page ??.)

`\l_CDR_info_tl` Token list for the info of line.

91 `\tl_new:N \l_CDR_info_tl`

(End definition for \l_CDR_info_tl. This variable is documented on page ??.)

5.5 Counters

\CDR_int_new:cn \CDR_int_new:cn {<tag name>} {<value>}

Create an integer after <tag name> and set it globally to <value>.

```

92 \cs_new:Npn \CDR_int_new:cn #1 #2 {
93   \int_new:c { CDR@int.#1 }
94   \int_gset:cn { CDR@int.#1 } { #2 }
95 }
```

default Generic and named line number counter.

```
96 \CDR_int_new:cn { default } { 1 }
```

(End definition for default. This variable is documented on page ??.)

__n Generic and named line number counter.

```
97 \CDR_int_new:cn { __n } { 1 }
```

(End definition for __n.)

__i Generic and named line number counter.

```
98 \CDR_int_new:cn { __i } { 1 }
```

(End definition for __i.)

__line Generic and named line number counter.

```
99 \CDR_int_new:cn { __line } { 1 }
```

(End definition for __line.)

\CDR_int:c * \CDR_int:c {<tag name>}

Use the integer named after <tag name>.

```

100 \cs_new:Npn \CDR_int:c #1 {
101   \use:c { CDR@int.#1 }
102 }
```

\CDR_int_use:c * \CDR_int_use:n {<tag name>}

Use the value of the integer named after <tag name>.

```

103 \cs_new:Npn \CDR_int_use:c #1 {
104   \int_use:c { CDR@int.#1 }
105 }
```

<code>\CDR_int_if_exist:p:c *</code> <code>\CDR_int_if_exist:cTF *</code>	<code>\CDR_int_if_exist:cTF {<tag name>} {<true code>} {<false code>}</code> Execute <i><true code></i> when an integer named after <i><tag name></i> exists, <i><false code></i> otherwise.
--	---

```

106 \prg_new_conditional:Nnn \CDR_int_if_exist:c { p, T, F, TF } {
107   \int_if_exist:cTF { CDR@int.#1 } {
108     \prg_return_true:
109   } {
110     \prg_return_false:
111   }
112 }

```

<code>\CDR_int_compare:p:cNn *</code> <code>\CDR_int_compare:cNnTF *</code>	<code>\CDR_int_compare:cNnTF {<tag name>} <operator> {<intexpr2>} {<true code>} {<false code>}</code>
--	---

Forwards to `\int_compare...` with `\CDR_int_use:c { #1 }`.

```

113 \prg_new_conditional:Nnn \CDR_int_compare:cNn { p, T, F, TF } {
114   \int_compare:nNnTF { \CDR_int:c { #1 } } #2 { #3 } {
115     \prg_return_true:
116   } {
117     \prg_return_false:
118   }
119 }

```

<code>\CDR_int_set:cn</code> <code>\CDR_int_gset:cn</code>	<code>\CDR_int_set:cn {<tag name>} {<value>}</code> Set the integer named after <i><tag name></i> to the <i><value></i> . <code>\CDR_int_gset:cn</code> makes a global change.
---	---

```

120 \cs_new:Npn \CDR_int_set:cn #1 #2 {
121   \int_set:cn { CDR@int.#1 } { #2 }
122 }
123 \cs_new:Npn \CDR_int_gset:cn #1 #2 {
124   \int_gset:cn { CDR@int.#1 } { #2 }
125 }

```

<code>\CDR_int_set:cc</code> <code>\CDR_int_gset:cc</code>	<code>\CDR_int_set:cc {<tag name>} {<other tag name>}</code> Set the integer named after <i><tag name></i> to the value of the integer named after <i><other tag name></i> . <code>\CDR_int_gset:cc</code> makes a global change.
---	--

```

126 \cs_new:Npn \CDR_int_set:cc #1 #2 {
127   \CDR_int_set:cn { #1 } { \CDR_int:c { #2 } }
128 }
129 \cs_new:Npn \CDR_int_gset:cc #1 #2 {
130   \CDR_int_gset:cn { #1 } { \CDR_int:c { #2 } }
131 }

```

<code>\CDR_int_add:cn</code> <code>\CDR_int_gadd:cn</code>	<code>\CDR_int_add:cn {<tag name>} {<value>}</code> Add the <code><value></code> to the integer named after <code><tag name></code> . <code>\CDR_int_gadd:cn</code> makes a global change.
---	---

```

132 \cs_new:Npn \CDR_int_add:cn #1 #2 {
133   \int_add:cn { CDR@int.#1 } { #2 }
134 }
135 \cs_new:Npn \CDR_int_gadd:cn #1 #2 {
136   \int_gadd:cn { CDR@int.#1 } { #2 }
137 }

```

<code>\CDR_int_add:cc</code> <code>\CDR_int_gadd:cc</code>	<code>\CDR_int_add:cn {<tag name>} {<other tag name>}</code> Add to the integer named after <code><tag name></code> the value of the integer named after <code><other tag name></code> . <code>\CDR_int_gadd:cc</code> makes a global change.
---	--

```

138 \cs_new:Npn \CDR_int_add:cc #1 #2 {
139   \CDR_int_add:cn { #1 } { \CDR_int:c { #2 } }
140 }
141 \cs_new:Npn \CDR_int_gadd:cc #1 #2 {
142   \CDR_int_gadd:cn { #1 } { \CDR_int:c { #2 } }
143 }

```

<code>\CDR_int_sub:cn</code> <code>\CDR_int_gsub:cn</code>	<code>\CDR_int_sub:cn {<tag name>} {<value>}</code> Subtract the <code><value></code> from the integer named after <code><tag name></code> . <code>\CDR_int_gsub:cn</code> makes a global change.
---	--

```

144 \cs_new:Npn \CDR_int_sub:cn #1 #2 {
145   \int_sub:cn { CDR@int.#1 } { #2 }
146 }
147 \cs_new:Npn \CDR_int_gsub:cn #1 #2 {
148   \int_gsub:cn { CDR@int.#1 } { #2 }
149 }

```

5.6 Utilities

<code>\g_CDR_tags_clist</code> <code>\g_CDR_all_tags_clist</code> <code>\g_CDR_last_tags_clist</code>	Store the current list of tags used by <code>\CDRCode</code> and the <code>CDRBlock</code> environment, or declared by <code>\CDRExport</code> . All the tags are recorded, if there is an only one, it is not shown in block code chunks. The <code>\g_CDR_last_tags_clist</code> variable contains the last list of tags that was displayed.
---	--

```

150 \clist_new:N \g_CDR_tags_clist
151 \clist_new:N \g_CDR_all_tags_clist
152 \clist_new:N \g_CDR_last_tags_clist
153 \AddToHook { shipout/before } {
154   \clist_gclear:N \g_CDR_last_tags_clist
155 }

```

(End definition for `\g_CDR_tags_clist`, `\g_CDR_all_tags_clist`, and `\g_CDR_last_tags_clist`. These variables are documented on page ??.)

```

156 \prg_new_conditional:Nnn \CDR_clist_if_eq:NN { p, T, F, TF } {
157   \tl_if_eq:NNTF #1 #2 {
158     \prg_return_true:
159   } {
160     \prg_return_false:
161   }
162 }

```

6 Tag properties

The tag properties concern the code chunks. They are set from different paths, such that `\l_keys_path_str` must be properly parsed for that purpose. Commands in this section and the next ones contain `CDR_tag`.

The `<tag names>` starting with a double underscore are reserved by the package.

6.1 Helpers

<code>\CDR_tag_get_path:cc</code>	<code>★</code>	<code>\CDR_tag_get_path:cc {<tag name>} {<relative key path>}</code>
<code>\CDR_tag_get_path:c</code>	<code>★</code>	<code>\CDR_tag_get_path:c {<relative key path>}</code>

Internal: return a unique key based on the arguments. Used to store and retrieve values. In the second version, the `<tag name>` is not provided and set to `__local`.

```

163 \cs_new:Npn \CDR_tag_get_path:cc #1 #2 {
164   \c_CDR_tag_get @ #1 / #2
165 }
166 \cs_new:Npn \CDR_tag_get_path:c {
167   \CDR_tag_get_path:cc { __local }
168 }

```

6.2 Set

<code>\CDR_tag_set:ccn</code>	<code>\CDR_tag_set:ccn {<tag name>} {<relative key path>} {<value>}</code>
<code>\CDR_tag_set:ccV</code>	

Store `<value>`, which is further retrieved with the instruction `\CDR_tag_get:cc {<tag name>} {<relative key path>}`. Only `<tag name>` and `<relative key path>` containing no `@` character are supported. All the affectations are made at the current T_EX group level. *Nota Bene:* `\cs_generate_variant:Nn` is buggy when there is a ‘c’ argument.

```

169 \cs_new_protected:Npn \CDR_tag_set:ccn #1 #2 #3 {
170   \cs_set:cpn { \CDR_tag_get_path:cc { #1 } { #2 } } { \exp_not:n { #3 } }
171 }
172 \cs_new_protected:Npn \CDR_tag_set:ccV #1 #2 #3 {
173   \exp_args:NnnV
174   \CDR_tag_set:ccn { #1 } { #2 } #3
175 }

```

`\c_CDR_tag_regex` To parse a l3keys full key path.

```

176 \tl_set:Nn \l_CDR_tl { /([~/]*)/(.*)$ } \use_none:n { $ }
177 \tl_put_left:NV \l_CDR_tl \c_CDR_tags
178 \tl_put_left:Nn \l_CDR_tl { ^ }
179 \exp_args:NNV
180 \regex_const:Nn \c_CDR_tag_regex \l_CDR_tl

(End definition for \c_CDR_tag_regex. This variable is documented on page ??.)

```

\CDR_tag_set:n \CDR_tag_set:n {<value>}

The value is provided but not the *<dir>* nor the *<relative key path>*, both are guessed from *\l_keys_path_str*. More precisely, *\l_keys_path_str* is expected to read something like *\c_CDR_tags/<tag name>/<relative key path>*, an error is raised on the contrary. This is meant to be called from *\keys_define:nn* argument. Implementation detail: the last argument is parsed by the last command.

```

181 \cs_new_protected:Npn \CDR_tag_set:n {
182   \exp_args:NnV
183   \regex_extract_once:NnNTF \c_CDR_tag_regex
184     \l_keys_path_str \l_CDR_seq {
185     \CDR_tag_set:ccn
186     { \seq_item:Nn \l_CDR_seq 2 }
187     { \seq_item:Nn \l_CDR_seq 3 }
188   } {
189     \PackageWarning
190       { coder }
191       { Unexpected-key~path~'\l_keys_path_str' }
192     \use_none:n
193   }
194 }

```

\CDR_tag_set: \CDR_tag_set:

None of *<dir>*, *<relative key path>* and *<value>* are provided. The latter is guessed from *\l_keys_value_tl*, and *\CDR_tag_set:n* is called. This is meant to be call from *\keys_define:nn* argument.

```

195 \cs_new_protected:Npn \CDR_tag_set: {
196   \exp_args:NV
197   \CDR_tag_set:n \l_keys_value_tl
198 }

```

\CDR_tag_set:cn \CDR_tag_set:cn {<key path>} {<value>}

When the last component of *\l_keys_path_str* should not be used to store the *<value>*, but *<key path>* should be used instead. This last component is replaced and *\CDR_tag_set:n* is called afterwards. Implementation detail: the second argument is parsed by the last command of the expansion.

```

199 \cs_new:Npn \CDR_tag_set:cn #1 {
200   \exp_args:NnV
201   \regex_extract_once:NnNTF \c_CDR_tag_regex
202     \l_keys_path_str \l_CDR_seq {

```

```

203     \CDR_tag_set:ccn
204         { \seq_item:Nn \l_CDR_seq 2 }
205         { #1 }
206     } {
207     \PackageWarning
208         { coder }
209         { Unexpected-key~path~'\l_keys_path_str' }
210     \use_none:n
211     }
212 }

```

\CDR_tag_choices: \CDR_tag_choices:

Ensure that the \l_keys_path_str is set properly. This is where a syntax like \keys_set:nn {...} { choice/a } is managed.

```

213 \prg_generate_conditional_variant:Nnn \str_if_eq:nn { Vn } { p, T, F, TF }
214
215 \regex_const:Nn \c_CDR_root_regex { ^(.*)/.*$ } \use_none:n { $ }
216 \cs_new:Npn \CDR_tag_choices: {
217     \str_if_eq:nnT \l_keys_key_tl \l_keys_choice_tl {
218         \exp_args:NnV
219         \regex_extract_once:NnNT \c_CDR_root_regex
220             \l_keys_path_str \l_CDR_seq {
221             \str_set:Nx \l_keys_path_str {
222                 \seq_item:Nn \l_CDR_seq 2
223             }
224         }
225     }
226 }

```

\CDR_tag_choices_set: \CDR_tag_choices_set:

Calls \CDR_tag_set:n with the content of \l_keys_choice_tl as value. Before, ensure that the \l_keys_path_str is set properly.

```

227 \cs_new_protected:Npn \CDR_tag_choices_set: {
228     \CDR_tag_choices:
229     \exp_args:NV
230     \CDR_tag_set:n \l_keys_choice_tl
231 }

```

<p>\CDR_if_tag_truthy_p:cc *</p> <p>\CDR_if_tag_truthy:ccTF *</p> <p>\CDR_if_tag_truthy_p:c *</p> <p>\CDR_if_tag_truthy:cTF *</p>	<p>\CDR_if_tag_truthy:ccTF {<tag name>} {<relative key path>} {<true code>} {<false code>}</p> <p>\CDR_if_tag_truthy:cTF {<relative key path>} {<true code>} {<false code>}</p>
---	---

Execute <true code> when the property for <tag name> and <relative key path> is a truthy value, <false code> otherwise. A truthy value is a text which is not “false” in a case insensitive comparison. In the second version, the <tag name> is not provided and set to __local.

```

232 \prg_new_conditional:Nnn \CDR_if_tag_truthy:cc { p, T, F, TF } {
233   \exp_args:Ne
234   \str_compare:nNnTF {
235     \exp_args:Ne \str_lowercase:n { \CDR_tag_get:cc { #1 } { #2 } }
236   } = { true } {
237     \prg_return_true:
238   } {
239     \prg_return_false:
240   }
241 }
242 \prg_new_conditional:Nnn \CDR_if_tag_truthy:c { p, T, F, TF } {
243   \exp_args:Ne
244   \str_compare:nNnTF {
245     \exp_args:Ne \str_lowercase:n { \CDR_tag_get:c { #1 } }
246   } = { true } {
247     \prg_return_true:
248   } {
249     \prg_return_false:
250   }
251 }

```

<code>\CDR_if_tag_eq_p:ccn</code>	<code>★ \CDR_if_tag_eq:ccnTF {<tag name>} {<relative key path>} {<value>} {<true code>}</code>
<code>\CDR_if_tag_eq:ccnTF</code>	<code>★ {<false code>}</code>
<code>\CDR_if_tag_eq_p:cn</code>	<code>★ \CDR_if_tag_eq:cnTF {<relative key path>} {<value>} {<true code>} {<false code>}</code>
<code>\CDR_if_tag_eq:cnTF</code>	<code>★</code>

Execute *<true code>* when the property for *<tag name>* and *<relative key path>* is equal to *{<value>}*, *<false code>* otherwise. The comparison is based on `\str_compare:...`. In the second version, the *<tag name>* is not provided and set to `__local`.

```

252 \prg_new_conditional:Nnn \CDR_if_tag_eq:ccn { p, T, F, TF } {
253   \exp_args:Nf
254   \str_compare:nNnTF { \CDR_tag_get:cc { #1 } { #2 } } = { #3 } {
255     \prg_return_true:
256   } {
257     \prg_return_false:
258   }
259 }
260 \prg_new_conditional:Nnn \CDR_if_tag_eq:cn { p, T, F, TF } {
261   \exp_args:Nf
262   \str_compare:nNnTF { \CDR_tag_get:cc { __local } { #1 } } = { #2 } {
263     \prg_return_true:
264   } {
265     \prg_return_false:
266   }
267 }

```

<code>\CDR_if_truthy_p:n</code>	<code>★ \CDR_if_truthy:nTF {<token list>} {<true code>} {<false code>}</code>
<code>\CDR_if_truthy:nTF</code>	<code>★</code>

Execute *<true code>* when *<token list>* is a truthy value, *<false code>* otherwise. A truthy value is a text which leading character, if any, is none of “fFnN”.

```

268 \prg_new_conditional:Nnn \CDR_if_truthy:n { p, T, F, TF } {
269   \exp_args:Ne

```

```

270 \str_compare:nNnTF { \exp_args:Ne \str_lowercase:n { #1 } } = { true } {
271   \prg_return_true:
272 } {
273   \prg_return_false:
274 }
275 }

```

```

\CDR_tag_boolean_set:n \CDR_tag_boolean_set:n {<choice>}

```

Calls `\CDR_tag_set:n` with `true` if the argument is `truthy`, `false` otherwise.

```

276 \cs_new_protected:Npn \CDR_tag_boolean_set:n #1 {
277   \CDR_if_truthy:nTF { #1 } {
278     \CDR_tag_set:n { true }
279   } {
280     \CDR_tag_set:n { false }
281   }
282 }
283 \cs_generate_variant:Nn \CDR_tag_boolean_set:n { x }

```

6.3 Retrieving tag properties

Internally, all tag properties are collected with a full key path like `\c_CDR_tag_get/<tag name>/<relative key path>`. When typesetting some code with either the `\CDRCode` command or the `CDRBlock` environment, all properties defined locally are collected under the reserved `\c_CDR_tag_get/__local/<relative path>` full key paths. The `l3keys` module `\c_CDR_tag_get/__local` is modified in `TeX` groups only. For running text code chunks, this module inherits from

1. `\c_CDR_tag_get/<tag name>` for the provided `<tag name>`,
2. `\c_CDR_tag_get/default.code`
3. `\c_CDR_tag_get/default`
4. `\c_CDR_tag_get/__pygments`
5. `\c_CDR_tag_get/__fancyvrb`
6. `\c_CDR_tag_get/__fancyvrb.all` when no using `pygments`

For text block code chunks, this module inherits from

1. `\c_CDR_tag_get/<name1>`, ..., `\c_CDR_tag_get/<namen>` for each tag name of the ordered tags list
2. `\c_CDR_tag_get/default.block`
3. `\c_CDR_tag_get/default`
4. `\c_CDR_tag_get/__pygments`
5. `\c_CDR_tag_get/__pygments.block`
6. `\c_CDR_tag_get/__fancyvrb`

7. \c_CDR_tag_get/___fancyvrb.block
8. \c_CDR_tag_get/___fancyvrb.all when no using pygments

```
\CDR_if_tag_exist_here:p:cc * \CDR_if_tag_exist_here:ccTF {<tag name>} <relative key path> {<true
\CDR_if_tag_exist_here:ccTF * code>} {<false code>}
```

If the <relative key path> is known within <tag name>, the <true code> is executed, otherwise, the <false code> is executed. No inheritance.

```
284 \prg_new_conditional:Nnn \CDR_if_tag_exist_here:cc { p, T, F, TF } {
285   \cs_if_exist:ctf { \CDR_tag_get_path:cc { #1 } { #2 } } {
286     \prg_return_true:
287   } {
288     \prg_return_false:
289   }
290 }
```

```
\CDR_if_tag_exist_p:cc * \CDR_if_tag_exist:ccTF {<tag name>} <relative key path> {<true code>} {<false
\CDR_if_tag_exist:ccTF * code>}
\CDR_if_tag_exist_p:c * \CDR_if_tag_exist:ctf <relative key path> {<true code>} {<false code>}
\CDR_if_tag_exist:ctf * 
```

If the <relative key path> is known within <tag name>, the <true code> is executed, otherwise, the <false code> is executed if none of the parents has the <relative key path> on its own. In the second version, the <tag name> is not provided and set to __local.

```
291 \prg_new_conditional:Nnn \CDR_if_tag_exist:cc { p, T, F, TF } {
292   \cs_if_exist:ctf { \CDR_tag_get_path:cc { #1 } { #2 } } {
293     \prg_return_true:
294   } {
295     \seq_if_exist:ctf { \CDR_tag_parent_seq:c { #1 } } {
296       \seq_map_tokens:cn
297         { \CDR_tag_parent_seq:c { #1 } }
298         { \CDR_if_tag_exist_f:cn { #2 } }
299     } {
300       \prg_return_false:
301     }
302   }
303 }
304 \prg_new_conditional:Nnn \CDR_if_tag_exist:c { p, T, F, TF } {
305   \cs_if_exist:ctf { \CDR_tag_get_path:c { #1 } } {
306     \prg_return_true:
307   } {
308     \seq_if_exist:ctf { \CDR_tag_parent_seq:c { __local } } {
309       \seq_map_tokens:cn
310         { \CDR_tag_parent_seq:c { __local } }
311         { \CDR_if_tag_exist_f:cn { #1 } }
312     } {
313       \prg_return_false:
314     }
315   }
316 }
```

```

317 \cs_new:Npn \CDR_if_tag_exist_f:cn #1 #2 {
318   \quark_if_no_value:nTF { #2 } {
319     \seq_map_break:n {
320       \prg_return_false:
321     }
322   } {
323     \CDR_if_tag_exist:ccT { #2 } { #1 } {
324       \seq_map_break:n {
325         \prg_return_true:
326       }
327     }
328   }
329 }

```

\CDR_tag_get:cc *	\CDR_tag_get:cc {<tag name>} {<relative key path>}
\CDR_tag_get:c *	\CDR_tag_get:c {<relative key path>}

The property value stored for <tag name> and <relative key path>. Takes care of inheritance. In the second version, the <tag name> is not provided an set to `__local`.

```

330 \cs_new:Npn \CDR_tag_get:cc #1 #2 {
331   \CDR_if_tag_exist_here:ccTF { #1 } { #2 } {
332     \use:c { \CDR_tag_get_path:cc { #1 } { #2 } }
333   } {
334     \seq_if_exist:cT { \CDR_tag_parent_seq:c { #1 } } {
335       \seq_map_tokens:cn
336       { \CDR_tag_parent_seq:c { #1 } }
337       { \CDR_tag_get_f:cn { #2 } }
338     }
339   }
340 }
341 \cs_new:Npn \CDR_tag_get_f:cn #1 #2 {
342   \quark_if_no_value:nF { #2 } {
343     \CDR_if_tag_exist_here:ccT { #2 } { #1 } {
344       \seq_map_break:n {
345         \use:c { \CDR_tag_get_path:cc { #2 } { #1 } }
346       }
347     }
348   }
349 }
350 \cs_new:Npn \CDR_tag_get:c {
351   \CDR_tag_get:cc { __local }
352 }

```

\CDR_tag_get:ccN	\CDR_tag_get:ccN {<tag name>} {<relative key path>} {<t1 variable>}
\CDR_tag_get:cN	\CDR_tag_get:cN {<relative key path>} {<t1 variable>}

Put in <t1 variable> the property value stored for the __local <tag name> and <relative key path>. In the second version, the <tag name> is not provided an set to __local.

```

353 \cs_new_protected:Npn \CDR_tag_get:ccN #1 #2 #3 {
354   \tl_set:Nf #3 { \CDR_tag_get:cc { #1 } { #2 } }
355 }
356 \cs_new_protected:Npn \CDR_tag_get:cN {
357   \CDR_tag_get:ccN { __local }
358 }

```

\CDR_tag_get:ccNTF	\CDR_tag_get:ccNTF {<tag name>} {<relative key path>} <t1 var> {<true code>}
\CDR_tag_get:cNTF	{<false code>}
	\CDR_tag_get:cNTF {<relative key path>} <t1 var> {<true code>} {<false code>}

Getter with branching. If the <relative key path> is known, save the value into <t1 var> and execute <true code>. Otherwise, execute <false code>. In the second version, the <tag name> is not provided an set to __local.

```

359 \prg_new_protected_conditional:Nnn \CDR_tag_get:ccN { T, F, TF } {
360   \CDR_if_tag_exist:ccTF { #1 } { #2 } {
361     \CDR_tag_get:ccN { #1 } { #2 } #3
362     \prg_return_true:
363   } {
364     \prg_return_false:
365   }
366 }
367 \prg_new_protected_conditional:Nnn \CDR_tag_get:cN { T, F, TF } {
368   \CDR_if_tag_exist:cTF { #1 } {
369     \CDR_tag_get:cN { #1 } #2
370     \prg_return_true:
371   } {
372     \prg_return_false:
373   }
374 }

```

6.4 Inheritance

When a child inherits from a parent, all the keys of the parent that are not inherited are made available to the child (inheritance does not jump over generations).

\CDR_tag_parent_seq:c ★	\CDR_tag_parent_seq:c {<tag name>}
-------------------------	------------------------------------

Return the name of the sequence variable containing the list of the parents. Each child has its own sequence of parents assigned locally.

```

375 \cs_new:Npn \CDR_tag_parent_seq:c #1 {
376   l_CDR:parent.tag @ #1 _seq
377 }

```

<code>\CDR_get_inherit:cn</code> <code>\CDR_get_inherit:cf</code> <code>\CDR_get_inherit:n</code> <code>\CDR_get_inherit:f</code>	<code>\CDR_get_inherit:cn {⟨child name⟩} {⟨parent names comma list⟩}</code> Set the parents of <code>⟨child name⟩</code> to the given list. When the <code>⟨child name⟩</code> is not provided, it defaults to <code>__local</code> .
--	--

```

378 \cs_new:Npn \CDR_get_inherit:cn #1 #2 {
379   \seq_set_from_clist:cn { \CDR_tag_parent_seq:c { #1 } } { #2 }
380   \seq_remove_duplicates:c \l_CDR_tl
381   \seq_remove_all:cn \l_CDR_tl {}
382   \seq_put_right:cn \l_CDR_tl { \q_no_value }
383 }
384 \cs_new:Npn \CDR_get_inherit:cf {
385   \exp_args:Nnf \CDR_get_inherit:cn
386 }
387 \cs_new:Npn \CDR_tag_parents:c #1 {
388   \seq_map_inline:cn { \CDR_tag_parent_seq:c { #1 } } {
389     \quark_if_no_value:nF { ##1 } {
390       ##1,
391     }
392   }
393 }
394 \cs_new:Npn \CDR_get_inherit:n {
395   \CDR_get_inherit:cn { __local }
396 }
397 \cs_new:Npn \CDR_get_inherit:f {
398   \CDR_get_inherit:cf { __local }
399 }

```

7 Cache management

If there is no `⟨jobname⟩.aux` file, there should be no cached files either, `coder-util.lua` is asked to clean all of them, if any.

```

400 \AddToHook { begindocument/before } {
401   \IfFileExists {./\jobname.aux} {} {
402     \lua_now:n {CDR:cache_clean_all()}
403   }
404 }

```

At the end of the document, `coder-util.lua` is asked to clean all unused cached files that could come from a previous process.

```

405 \AddToHook { enddocument/end } {
406   \lua_now:n {CDR:cache_clean_unused()}
407 }

```

8 Utilities

\CDR_clist_map_inline:Nnn \CDR_clist_map_inline:Nnn *<clist var>* *{<empty code>}* *{<non empty code>}*
 Execute *<empty code>* when the list is empty, otherwise call **\clist_map_inline:Nn** with *<non empty code>*.

```

408 \cs_new:Npn \CDR_clist_map_inline:Nnn #1 #2 {
409   \clist_if_empty:NTF #1 {
410     #2
411     \use_none:n
412   } {
413     \clist_map_inline:Nn #1
414   }
415 }
```

\CDR_if_block_p: * \CDR_if_block:TF *{<true code>}* *{<false code>}*
\CDR_if_block:TF * Execute *<true code>* when inside a code block, *<false code>* when inside an inline code.
 Raises an error otherwise.

```

416 \prg_new_conditional:Nnn \CDR_if_block: { p, T, F, TF } {
417   \PackageError
418     { coder }
419     { Conditional~not~available }
420     { Internal~error:~report~bug }
421 }
```

\CDR_process_record: Record the current line or not. The default implementation does nothing and is meant to be defines locally.

```

422 \cs_new:Npn \CDR_process_record: {}
```

9 l3keys modules for code chunks

All these modules are initialized at the beginning of the document using the `__initialize` meta key.

9.1 Utilities

\CDR_tag_module:n ★ \CDR_tag_module:n {<module base>}

The <module> is uniquely based on <module base>. This should be f expanded when used as n argument of l3keys functions.

```

423 \cs_set:Npn \CDR_tag_module:n #1 {
424   \str_if_eq:nnTF { #1 } { .. } {
425     \c_CDR_Tag
426   } {
427     \tl_if_empty:nTF { #1 } { \c_CDR_tags } { \c_CDR_tags / #1 }
428   }
429 }
```

\CDR_tag_keys_define:nn \CDR_tag_keys_define:nn {<module base>} {<keyval list>}

The <module> is uniquely based on <module base> before forwarding to \keys_define:nn.

```

430 \cs_new:Npn \CDR_tag_keys_define:nn #1 {
431   \exp_args:Nf
432   \keys_define:nn { \CDR_tag_module:n { #1 } }
433 }
```

\CDR_tag_keys_if_exist:nnTF ★ \CDR_tag_keys_if_exist:nnTF {<module base>} {<key>} {<true code>} {<false code>}

Execute <true code> if there is a <key> for the given <module base>, <false code> otherwise. If <module base> is empty, {<key>} is the module base used.

```

434 \prg_new_conditional:Nnn \CDR_tag_keys_if_exist:nn { p, T, F, TF } {
435   \exp_args:Nf
436   \keys_if_exist:nnTF { \CDR_tag_module:n { #1 } } { #2 } {
437     \prg_return_true:
438   } {
439     \prg_return_false:
440   }
441 }
```

\CDR_tag_keys_set:nn \CDR_tag_keys_set:nn {<module base>} {<keyval list>}

The <module> is uniquely based on <module base> before forwarding to \keys_set:nn.

```

442 \cs_new_protected:Npn \CDR_tag_keys_set:nn #1 {
443   \exp_args:Nf
444   \keys_set:nn { \CDR_tag_module:n { #1 } }
445 }
446 \cs_generate_variant:Nn \CDR_tag_keys_set:nn { nV }
```

```
\CDR_tag_keys_set:nn \CDR_tag_keys_set:nn {<module base>} {<keyval list>}
```

The *<module>* is uniquely based on *<module base>* before forwarding to *\keys_set:nn*.

```
447 \cs_new_protected:Npn \CDR_local_set:n {
448   \CDR_tag_keys_set:nn { __local }
449 }
450 \cs_generate_variant:Nn \CDR_local_set:n { V }
```

9.1.1 Handling unknown tags

While using *\keys_set:nn* and variants, each time a full key path matching the pattern *\c_CDR_tag/<tag name>/<relative key path>* is not recognized, we assume that the client implicitly wants a tag with the given *<tag name>* to be defined. For that purpose, we collect unknown keys with *\keys_set_known:nnnN* then process them to find each *<tag name>* and define the new tag accordingly. A similar situation occurs for display engine options where the full key path reads *\c_CDR_tag/<tag name>/<engine name>* engine options where *<engine name>* is not known in advance.

```
\CDR_tag_keys_inherit:nn \CDR_tag_keys_inherit:nn {<tag name>} {<parents comma list>}
```

Set the inheritance: *<tag name>* inherits from each parent, which is a tag name.

```
451 \cs_new_protected_nopar:Npn \CDR_tag_keys_inherit__:nnn #1 #2 #3 {
452   \keys_define:nn { #1 } { #2 .inherit:n = { #1 / #3 } }
453 }
454 \cs_new_protected_nopar:Npn \CDR_tag_keys_inherit_:nnn #1 #2 #3 {
455   \exp_args:Nnx
456   \use:n { \CDR_tag_keys_inherit__:nnn { #1 } { #2 } } {
457     \clist_use:nn { #3 } { ,#1/ }
458   }
459 }
460 \cs_new_protected_nopar:Npn \CDR_tag_keys_inherit:nn {
461   \exp_args:Nf
462   \CDR_tag_keys_inherit_:nnn { \CDR_tag_module:n { } }
463 }
```

```
\CDR_local_inherit:n Wrapper over \CDR_tag_keys_inherit:nn where <tag name> is
given by \CDR_tag_module:n{__local}.
```

Set the inheritance: *<tag name>* inherits from each parent, which is a tag name.

```
464 \cs_new_protected_nopar:Npn \CDR_local_inherit:n {
465   \CDR_tag_keys_inherit:nn { __local }
466 }
```

```
\CDR_tag_keys_set_known:nnN \CDR_tag_keys_set_known:nnN {<tag name>} {<key[=value] items>} <clist var>
\CDR_tag_keys_set_known:nVN \CDR_tag_keys_set_known:nN {<tag name>} <clist var>
\CDR_tag_keys_set_known:nN
\CDR_tag_keys_set_known:N
```

Wrappers over *\keys_set_known:nnnN* where the module is given by *\CDR_tag_module:n{<tag name>}*. *Implementation detail* the remaining arguments are absorbed by the last macro. When *<key[=value] items>* is omitted, it is the content of *<clist var>*.

```

467 \cs_new_protected_nopar:Npn \CDR_tag_keys_set_known__:nnN #1 #2 {
468   \keys_set_known:nnnN { #1 } { #2 } { #1 }
469 }
470 \cs_new_protected_nopar:Npn \CDR_tag_keys_set_known:nnN #1 {
471   \exp_args:Nf
472   \CDR_tag_keys_set_known__:nnN { \CDR_tag_module:n { #1 } }
473 }
474 \cs_generate_variant:Nn \CDR_tag_keys_set_known:nnN { nV }
475 \cs_new_protected_nopar:Npn \CDR_tag_keys_set_known:nN #1 #2 {
476   \CDR_tag_keys_set_known:nVN { #1 } #2 #2
477 }

```

```

\CDR_tag_keys_set_known:nnN   \CDR_local_set_known:nN {<key[=value] items>} <clist var>
\CDR_tag_keys_set_known:nVN   \CDR_local_set_known:N <clist var>
\CDR_tag_keys_set_known:nN
\CDR_tag_keys_set_known:N

```

Wrappers over `\CDR_tag_keys_set_known:...` where the module is given by `\CDR_tag_module:n{__local}`. When `<key[=value] items>` is omitted, it is the content of `<clist var>`.

```

478 \cs_new_protected_nopar:Npn \CDR_local_set_known:nN {
479   \CDR_tag_keys_set_known:nnN { __local }
480 }
481 \cs_generate_variant:Nn \CDR_local_set_known:nN { V }
482 \cs_new_protected_nopar:Npn \CDR_local_set_known:N #1 {
483   \CDR_local_set_known:VN #1 #1
484 }

```

`\c_CDR_provide_regex` To parse a l3keys full key path.

```

485 \tl_set:Nn \l_CDR_tl { /([~/*])(?:/(.))*?$ } \use_none:n { $ }
486 \exp_args:NNf
487 \tl_put_left:Nn \l_CDR_tl { \CDR_tag_module:n { } }
488 \tl_put_left:Nn \l_CDR_tl { ^ }
489 \exp_args:NNV
490 \regex_const:Nn \c_CDR_provide_regex \l_CDR_tl

```

(End definition for `\c_CDR_provide_regex`. This variable is documented on page ??.)

```

\@CDR@TEST      \CDR_tag_provide:n {<deep comma list>}
\CDR_tag_provide_from_kv:n \CDR_tag_provide_from_kv:n {<key-value list>}

```

`<deep comma list>` has format `tag/<tag name comma list>`. Parse the `<key-value list>` for full key path matching `tag/<tag name>/<relative key path>`, then ensure that `\c_CDR_tag/<tag name>` is a known full key path. For that purpose, we use `\keyval_parse:nnn` with two `\CDR_tag_provide:` helper.

Notice that a tag name should contain no `/`. Implementation detail: uses `\l_CDR_tl`.

```

491 \regex_const:Nn \c_CDR_engine_regex { ^([~/*]+\sengine\soptions$ ) \use_none:n { $ }
492 \cs_new_protected_nopar:Npn \CDR_tag_provide:n #1 {
493   \CDR@Debug { \string\CDR_tag_provide:n~#1 }

553 }
554 \cs_generate_variant:Nn \CDR_tag_provide_from_kv:n { V }

```

9.2 pygments

These are `pygments`'s `LatexFormatter` options, that are not covered by `__fancyvrb`. They are made available at the end user level, but may not be relevant when `pygments` is not used.

9.2.1 `__pygments` `l3keys` module

```

555 \CDR_tag_keys_define:nn { __pygments } {

```

- **lang**=*<language name>* where *<language name>* is recognized by `pygments`, including a void string,

```

556   lang .code:n = \CDR_tag_set:,
557   lang .value_required:n = true,

```

- **pygments**[*=true|false*] whether `pygments` should be used for syntax coloring. Initially true if `pygments` is available, false otherwise.

```

558   pygments .code:n = \CDR_tag_boolean_set:x { #1 },
559   pygments .default:n = true,

```

- **style**=*<style name>* where *<style name>* is recognized by `pygments`, including a void string,

```

560   style .code:n = \CDR_tag_set:,
561   style .value_required:n = true,

```

- **commandprefix**=*<text>* The \LaTeX commands used to produce colored output are constructed using this prefix and some letters. Initially `Py`.

```

562   commandprefix .code:n = \CDR_tag_set:,
563   commandprefix .value_required:n = true,

```

- **mathescape**[*=true|false*] If set to true, enables \LaTeX math mode escape in comments. That is, `$...$` inside a comment will trigger math mode. Initially false.

```

564   mathescape .code:n = \CDR_tag_boolean_set:x { #1 },
565   mathescape .default:n = true,

```

- **escapeinside**=*<before><after>* If set to a string of length 2, enables escaping to \LaTeX . Text delimited by these 2 characters is read as \LaTeX code and typeset accordingly. It has no effect in string literals. It has no effect in comments if `texcomments` or `mathescape` is set. Initially empty.

```

566   escapeinside .code:n = \CDR_tag_set:,
567   escapeinside .value_required:n = true,

```

● **__initialize** Initializer.

```
568 __initialize .meta:n = {
569     lang = tex,
570     pygments = \CDR_has_pygments:TF { true } { false },
571     style = default,
572     commandprefix = PY,
573     mathescape = false,
574     escapeinside = ,
575 },
576 __initialize .value_forbidden:n = true,

577 }
578 \AtBeginDocument{
579     \CDR_tag_keys_set:nn { __pygments } { __initialize }
580 }
```

9.2.2 __pygments.block l3keys module

```
581 \CDR_tag_keys_define:nn { __pygments.block } {
```

● **texcomments**[=true|false] If set to true, enables L^AT_EX comment lines. That is, L^AT_EX markup in comment tokens is not escaped so that L^AT_EX can render it. Initially false.

```
582     texcomments .code:n = \CDR_tag_boolean_set:x { #1 },
583     texcomments .default:n = true,
```

● **__initialize** Initializer.

```
584     __initialize .meta:n = {
585         texcomments = false,
586     },
587     __initialize .value_forbidden:n = true,

588 }
589 \AtBeginDocument{
590     \CDR_tag_keys_set:nn { __pygments.block } { __initialize }
591 }
```

9.3 Specific to coder

9.3.1 default l3keys module

```
592 \CDR_tag_keys_define:nn { default } {
```

Keys are:

● **format**=*(format commands)* the format used to display the code (mainly font, size and color), after the font has been selected. Initially empty.

```
593     format .code:n = \CDR_tag_set:,
594     format .value_required:n = true,
```

- **cache** Set to true if coder-tool.py should use already existing files instead of creating new ones. Initially true.

```
595 cache .code:n = \CDR_tag_boolean_set:x { #1 },
596 cache .default:n = true,
```

- **debug** Set to true if various debugging messages should be printed to the console . Initially false.

```
597 debug .code:n = \CDR_tag_boolean_set:x { #1 },
598 debug .default:n = true,
```

- **post processor=***<command>* the command for pygments post processor. This is a string where every occurrence of “%%file%%” is replaced by the full path of the *.pyg.tex file to be post processed and then executed as terminal instruction. Initially empty.

```
599 post~processor .code:n = \CDR_tag_set:,
600 post~processor .value_required:n = true,
```

- **default engine options=***<default engine options>* to specify the corresponding options,

```
601 default~engine~options .code:n = \CDR_tag_set:,
602 default~engine~options .value_required:n = true,
```

- **default options=***<default options>* to specify the coder options that should apply when the default engine is selected.setup_tags

```
603 default~options .code:n = \CDR_tag_set:,
604 default~options .value_required:n = true,
```

- **<engine name> engine options=***<engine options>* to specify the options for the named engine,

- **<engine name> options=***<coder options>* to specify the coder options that should apply when the named engine is selected.

- **__initialize** to initialize storage properly. We cannot use .initial:n actions because the \l_keys_path_str is not set up properly.

```
605 __initialize .meta:n = {
606   format = ,
607   cache = true,
608   debug = false,
609   post~processor = ,
610   default~engine~options = ,
611   default~options = ,
612 },
613 __initialize .value_forbidden:n = true,

614 }
615 \AtBeginDocument{
616   \CDR_tag_keys_set:nn { default } { __initialize }
617 }
```

9.3.2 default.code l3keys module

Void for the moment.

```
618 \CDR_tag_keys_define:nn { default.code } {
```

Known keys include:

● **mbox[=true|false]** When set to `true`, put the argument inside a \LaTeX `mbox` to prevent the code chunk to spread over different lines. Initially `true`.

```
619   mbox .code:n = \CDR_tag_boolean_set:x { #1 },
```

```
620   mbox .default:n = true,
```

● **__initialize** to initialize storage properly. We cannot use `.initial:n` actions because the `\l_keys_path_str` is not set up properly.

```
621   __initialize .meta:n = {
```

```
622     mbox = true,
```

```
623   },
```

```
624   __initialize .value_forbidden:n = true,
```

```
625 }
```

```
626 \AtBeginDocument{
```

```
627   \CDR_tag_keys_set:nn { default.code } { __initialize }
```

```
628 }
```

9.3.3 __tags l3keys module

The only purpose is to catch only the `tags` key very early.

```
629 \CDR_tag_keys_define:nn { __tags } {
```

Known keys include:

● **tags=<comma list of tag names>** to enable/disable the display of the code chunks `tags`, setup some style, export. Initially `empty`. to export and display.

```
630   tags .code:n = {
```

```
631     \clist_set:Nx \l_CDR_clist { #1 }
```

```
632     \clist_remove_duplicates:N \l_CDR_clist
```

```
633     \exp_args:NV
```

```
634     \CDR_tag_set:n \l_CDR_clist
```

```
635   },
```

```
636   tags .value_required:n = true,
```

● **__initialize** Initialization.

```
637   __initialize .meta:n = {
```

```
638     tags = ,
```

```
639   },
```

```
640   __initialize .value_forbidden:n = true,
```

```
641 }
```

```
642 \AtBeginDocument{
```

```
643   \CDR_tag_keys_set:nn { __tags } { __initialize }
```

```
644 }
```

There is a companion module to catch unexpected `tags` key. Used for `coder` options when defining engines.

```
645 \CDR_tag_keys_define:nn { __no_tags } {
646   tags .code:n = {
647     \PackageError
648       { coder }
649       { Key~'tags'~is~forbidden~for~engines }
650       { See~the~coder~manual }
651   }
652 }
```

9.3.4 `__engine` `!keys` module

The only purpose is to catch only the `engine` key very early, just after the `tags` key.

```
653 \CDR_tag_keys_define:nn { __engine } {
```

Known keys include:

 **engine**=*(engine name)* to specify the engine used to display inline code or blocks. Initially default.

```
654   engine .code:n = \CDR_tag_set:,
655   engine .value_required:n = true,
```

 **__initialize** Initialization.

```
656   __initialize .meta:n = {
657     engine = default,
658   },
659   __initialize .value_forbidden:n = true,

660 }
661 \AtBeginDocument{
662   \CDR_tag_keys_set:nn { __engine } { __initialize }
663 }
```

There is a companion module to catch unexpected `tags` key. Used for `coder` options when defining engines.

```
664 \CDR_tag_keys_define:nn { __no_engine } {
665   engine .code:n = {
666     \PackageError
667       { coder }
668       { Key~'engine'~is~forbidden~for~engines }
669       { See~the~coder~manual }
670   }
671 }
```

9.3.5 default.block l3keys module

```
672 \CDR_tag_keys_define:nn { default.block } {
```

Known keys include:

- **tags format**=*(format commands)* , where *(format)* is used the format used to display the tag names (mainly font, size and color), after it is appended to the numbers format. Initially empty.

```
673 tags~format .code:n = \CDR_tag_set:,
674 tags~format .value_required:n = true,
```

- **numbers format**=*(format commands)* the format used to display line numbers (mainly font, size and color).

```
675 numbers~format .code:n = \CDR_tag_set:,
676 numbers~format .value_required:n = true,
```

- **show tags**=[*true|false*] whether tags should be displayed.

```
677 show~tags .choices:nn =
678   { none, left, right, same, mirror, dry }
679   { \CDR_tag_choices_set: },
680 show~tags .default:n = same,
```

- **only top**=[*true|false*] to avoid chunk tags repetitions, if on the same page, two consecutive code chunks have the same tag names, the second names are not displayed.

```
681 only~top .code:n = \CDR_tag_boolean_set:x { #1 },
682 only~top .default:n = true,
```

- **use margin**=[*true|false*] to use the margin to display line numbers and tag names, or not, UNUSED

```
683 use~margin .code:n = \CDR_tag_boolean_set:x { #1 },
684 use~margin .default:n = true,
```

- **__initialize** Initialization.

```
685 __initialize .meta:n = {
686   show~tags = same,
687   only~top = true,
688   use~margin = true,
689   numbers~format = {
690     \sffamily
691     \scriptsize
692     \color{gray}
693   },
694   tags~format = {
695     \bfseries
696   },
697 },
698 __initialize .value_forbidden:n = true,
699 }
700 \AtBeginDocument{
701   \CDR_tag_keys_set:nn { default.block } { __initialize }
702 }
```

9.4 fancyvrb

These are `fancyvrb` options verbatim. The `fancyvrb` manual has more details, only some parts are reproduced hereafter. All of these options may not be relevant for all situations. Some of them make no sense in `code` mode, whereas others may not be compatible with the display engine.

9.4.1 `__fancyvrb` `l3keys` module

```
703 \CDR_tag_keys_define:nn { __fancyvrb } {
```

● **formatcom**=*<command>* execute before printing verbatim text. Initially empty.

```
704   formatcom .code:n = \CDR_tag_set:,
705   formatcom .value_required:n = true,
```

● **fontfamily**=*<family name>* font family to use. `tt`, `courier` and `helvetica` are pre-defined. Initially `tt`.

```
706   fontfamily .code:n = \CDR_tag_set:,
707   fontfamily .value_required:n = true,
```

● **fontsize**=** size of the font to use. If you use the `relsize` package as well, you can require a change of the size proportional to the current one (for instance: `fontsize=\relsize{-2}`). Initially `auto`: the same as the current font.

```
708   fontsize .code:n = \CDR_tag_set:,
709   fontsize .value_required:n = true,
```

● **fontshape**=** font shape to use. Initially `auto`: the same as the current font.

```
710   fontshape .code:n = \CDR_tag_set:,
711   fontshape .value_required:n = true,
```

● **fontseries**=*<series name>* L^AT_EX font series to use. Initially `auto`: the same as the current font.

```
712   fontseries .code:n = \CDR_tag_set:,
713   fontseries .value_required:n = true,
```

● **showspaces**[*=true|false*] print a special character representing each space. Initially `false`: spaces not shown.

```
714   showspaces .code:n = \CDR_tag_boolean_set:x { #1 },
715   showspaces .default:n = true,
```

● **showtabs**=*true|false* explicitly show tab characters. Initially `false`: tab characters not shown.

```
716   showtabs .code:n = \CDR_tag_boolean_set:x { #1 },
717   showtabs .default:n = true,
```

- **obeytabs=true|false** position characters according to the tabs. Initially false: tab characters are added to the current position.

```
718 obeytabs .code:n = \CDR_tag_boolean_set:x { #1 },
719 obeytabs .default:n = true,
```

- **tabsize=<integer>** number of spaces given by a tab character, Initially 2 (8 for fancyvrb).

```
720 tabsize .code:n = \CDR_tag_set:,
721 tabsize .value_required:n = true,
```

- **defineactive=<macro>** to define the effect of active characters. This allows to do some devious tricks, see the fancyvrb package. Initially empty.

```
722 defineactive .code:n = \CDR_tag_set:,
723 defineactive .value_required:n = true,
```

- ✓ **relabel=<label>** define a label to be used with \pageref. Initially empty.

```
724 relabel .code:n = \CDR_tag_set:,
725 relabel .value_required:n = true,
```

- ✓ **__initialize** Initialization.

```
726 __initialize .meta:n = {
727   formatcom = ,
728   fontfamily = tt,
729   fontsize = auto,
730   fontseries = auto,
731   fontshape = auto,
732   showspaces = false,
733   showtabs = false,
734   obeytabs = false,
735   tabsize = 2,
736   defineactive = ,
737   relabel = ,
738 },
739 __initialize .value_forbidden:n = true,

740 }
741 \AtBeginDocument{
742   \CDR_tag_keys_set:nn { __fancyvrb } { __initialize }
743 }
```

9.4.2 __fancyvrb.frame l3keys module

Block specific options, frame related.

```
744 \CDR_tag_keys_define:nn { __fancyvrb.frame } {
```

- **frame=none|leftline|topline|bottomline|lines|single** type of frame around the verbatim environment. With leftline and single modes, a space of a length given by the L^AT_EX \fboxsep macro is added between the left vertical line and the text. Initially none: no frame.

```

745   frame .choices:nn =
746     { none, leftline, topline, bottomline, lines, single }
747     { \CDR_tag_choices_set: },

```

● **framerule**= $\langle dimension \rangle$ width of the rule of the frame if any. Initially 0.4pt.

```

748   framerule .code:n = \CDR_tag_set:,
749   framerule .value_required:n = true,

```

● **framesep**= $\langle dimension \rangle$ width of the gap between the frame (if any) and the text. Initially `\fboxsep`.

```

750   framesep .code:n = \CDR_tag_set:,
751   framesep .value_required:n = true,

```

● **rulecolor**= $\langle color\ command \rangle$ color of the frame rule, expressed in the standard L^AT_EX way. Initially black.

```

752   rulecolor .code:n = \CDR_tag_set:,
753   rulecolor .value_required:n = true,

```

● **rulecolor**= $\langle color\ command \rangle$ color used to fill the space between the frame and the text (its thickness is given by `framesep`). Initially empty.

```

754   fillcolor .code:n = \CDR_tag_set:,
755   fillcolor .value_required:n = true,

```

● **labelposition**=`none|topline|bottomline|all` position where to print the label(s) when defined. When options happen to be contradictory, like `frame=topline` and `labelposition=bottomline`, nothing is displayed. Initially `none` when no labels are defined, `topline` for one label and `all` otherwise.

```

756   labelposition .choices:nn =
757     { none, topline, bottomline, all }
758     { \CDR_tag_choices_set: },

```

✓ **__initialize** Initialization.

```

759   __initialize .meta:n = {
760     frame = none,
761     framerule = 0.4pt,
762     framesep = \fboxsep,
763     rulecolor = black,
764     fillcolor = ,
765     labelposition = none,% auto?
766   },
767   __initialize .value_forbidden:n = true,

768 }
769 \AtBeginDocument{
770   \CDR_tag_keys_set:nn { __fancyvrb.frame } { __initialize }
771 }

```

9.4.3 `__fancyvrb.block` l3keys module

Block specific options, except numbering.

```
772 \regex_const:Nn \c_CDR_int_regex { ^(+|-)?\d+$ } \use_none:n { $ }
773 \CDR_tag_keys_define:nn { __fancyvrb.block } {
```

- **commentchar**=*<character>* lines starting with this character are ignored. Initially empty.

```
774 commentchar .code:n = \CDR_tag_set:,
775 commentchar .value_required:n = true,
```

- **gobble**=*<integer>* number of characters to suppress at the beginning of each line (from 0 to 9), mainly useful when environments are indented. Only `block` mode.

```
776 gobble .choices:nn = {
777   0,1,2,3,4,5,6,7,8,9
778 } {
779   \CDR_tag_choices_set:
780 },
```

- **baselinestretch**=*auto|<dimension>* value to give to the usual `\baselinestretch` L^AT_EX parameter. Initially `auto`: its current value just before the verbatim command.

```
781 baselinestretch .code:n = \CDR_tag_set:,
782 baselinestretch .value_required:n = true,
```

- ⊘ **commandchars**=*<three characters>* characters which define the character which starts a macro and marks the beginning and end of a group; thus lets us introduce escape sequences in verbatim code. Of course, it is better to choose special characters which are not used in the verbatim text. Private to `coder`, unavailable to users.

- **xleftmargin**=*<dimension>* indentation to add at the start of each line. Initially `0pt`: no left margin.

```
783 xleftmargin .code:n = \CDR_tag_set:,
784 xleftmargin .value_required:n = true,
```

- **xrightmargin**=*<dimension>* right margin to add after each line. Initially `0pt`: no right margin.

```
785 xrightmargin .code:n = \CDR_tag_set:,
786 xrightmargin .value_required:n = true,
```

- **resetmargins**[*=true|false*] reset the left margin, which is useful if we are inside other indented environments. Initially `true`.

```
787 resetmargins .code:n = \CDR_tag_boolean_set:x { #1 },
788 resetmargins .default:n = true,
```

- **hfuzz**=*<dimension>* value to give to the T_EX `\hfuzz` dimension for text to format. This can be used to avoid seeing some unimportant overfull box messages. Initially `2pt`.

```

789 hfuzz .code:n = \CDR_tag_set:,
790 hfuzz .value_required:n = true,

```

● **vspace**= $\langle dimension \rangle$ the amount of vertical space added to `\parskip` before and after blocks. Initially `\topsep`.

```

791 vspace .code:n = \CDR_tag_set:,
792 vspace .value_required:n = true,

```

● **samepage**[`=true|false`] in very special circumstances, we may want to make sure that a verbatim environment is not broken, even if it does not fit on the current page. To avoid a page break, we can set the `samepage` parameter to `true`. Initially `false`.

```

793 samepage .code:n = \CDR_tag_boolean_set:x { #1 },
794 samepage .default:n = true,

```

● **label**={ $\langle top\ string \rangle$] $\langle string \rangle$ } label(s) to print on top, bottom or both, frame lines. If the label(s) contains special characters, comma or equal sign, it must be placed inside a group. If an optional $\langle top\ string \rangle$ is given between square brackets, it will be used for the top line and $\langle string \rangle$ for the bottom line. Otherwise, $\langle string \rangle$ is used for both the top or bottom lines. Label(s) are printed only if the `frame` parameter is one of `topline`, `bottomline`, `lines` or `single`. Initially empty: no label.

```

795 label .code:n = \CDR_tag_set:,
796 label .value_required:n = true,

```

✓ **__initialize** Initialization.

```

797 __initialize .meta:n = {
798   commentchar = ,
799   gobble = 0,
800   baselinestretch = auto,
801   resetmargins = true,
802   xleftmargin = 0pt,
803   xrightmargin = 0pt,
804   hfuzz = 2pt,
805   vspace = \topset,
806   samepage = false,
807   label = ,
808 },
809 __initialize .value_forbidden:n = true,
810 }
811 \AtBeginDocument{
812   \CDR_tag_keys_set:nn { __fancyvrb.block } { __initialize }
813 }

```

9.4.4 `__fancyvrb.number l3keys` module

Block line numbering.

```

814 \CDR_tag_keys_define:nn { __fancyvrb.number } {

```

● **numbers=none|left|right** numbering of the verbatim lines. If requested, this numbering is done outside the verbatim environment. Initially none: no numbering.

```
815 numbers .choices:nn =
816   { none, left, right }
817   { \CDR_tag_choices_set: },
```

● **numbersep=<dimension>** gap between numbers and verbatim lines. Initially 12pt.

```
818 numbersep .code:n = \CDR_tag_set:,
819 numbersep .value_required:n = true,
```

● **firstnumber=auto|last|<integer>** number of the first line. **last** means that the numbering is continued from the previous verbatim environment. If an integer is given, its value will be used to start the numbering. Initially **auto**: numbering starts from 1.

```
820 firstnumber .code:n = {
821   \regex_match:NnTF \c_CDR_int_regex { #1 } {
822     \CDR_tag_set:
823   } {
824     \str_case:nnF { #1 } {
825       { auto } { \CDR_tag_set: }
826       { last } { \CDR_tag_set: }
827     } {
828       \PackageWarning
829         { CDR }
830         { Value~‘#1’~not~in~auto,~last. }
831     }
832   }
833 },
834 firstnumber .value_required:n = true,
```

● **stepnumber=<integer>** interval at which line numbers are printed. Initially 1: all lines are numbered.

```
835 stepnumber .code:n = \CDR_tag_set:,
836 stepnumber .value_required:n = true,
```

● **numberblanklines[=true|false]** to number or not the white lines (really empty or containing blank characters only). Initially **true**: all lines are numbered.

```
837 numberblanklines .code:n = \CDR_tag_boolean_set:x { #1 },
838 numberblanklines .default:n = true,
```

● **firstline=<integer>|<regex>** first line to print. Initially empty: all lines from the first are printed.

```
839 firstline .code:n = {
840   \regex_match:NnTF \c_CDR_int_regex { #1 } {
841     \CDR_tag_set:
842   } {
```

```

843     \tl_if_empty:nTF { #1 } {
844         \CDR_tag_set:
845     } {
846         \CDR_tag_set:n { \unexpanded { #1 } }
847     }
848 }
849 },
850 firstline .value_required:n = true,

```

🔴 **lastline**= $\langle integer \rangle | \langle regex \rangle$ last line to print. Initially empty: all lines until the last one are printed.

```

851 lastline .code:n = {
852     \regex_match:NnTF \c_CDR_int_regex { #1 } {
853         \CDR_tag_set:n { #1 }
854     } {
855         \CDR_tag_set:n { \unexpanded { #1 } }
856     }
857 },
858 lastline .value_required:n = true,

```

✅ **__initialize** Initialization.

```

859 __initialize .meta:n = {
860     numbers = left,
861     numbersep = lex,
862     firstnumber = auto,
863     stepnumber = 1,
864     numberblanklines = true,
865     firstline = ,
866     lastline = ,
867 },
868 __initialize .value_forbidden:n = true,
869 }
870 \AtBeginDocument{
871     \CDR_tag_keys_set:nn { __fancyvrb.number } { __initialize }
872 }

```

9.4.5 **__fancyvrb.all** l3keys module

Options available when `pygments` is not used.

```

873 \CDR_tag_keys_define:nn { __fancyvrb.all } {

```

🔴 **commandchars**= $\langle three\ characters \rangle$ characters that define the character that starts a macro and marks the beginning and end of a group; allows to introduce escape sequences in the verbatim code. Of course, it is better to choose special characters that are not used in the verbatim text! Initially **none**. Ignored in **pygments** mode.

```

874 commandchars .code:n = \CDR_tag_set:,
875 commandchars .value_required:n = true,

```

🔴 **codes**= $\langle macro \rangle$ to specify catcode changes. For instance, this allows us to include formatted mathematics in verbatim text. Initially empty. Ignored in **pygments** mode.

```

876 codes .code:n = \CDR_tag_set:,
877 codes .value_required:n = true,

✓ __initialize Initialization.

878 __initialize .meta:n = {
879   commandchars = ,
880   codes = ,
881 },
882 __initialize .value_forbidden:n = true,

883 }
884 \AtBeginDocument{
885   \CDR_tag_keys_set:nn { __fancyvrb.all } { __initialize }
886 }

```

10 \CDRSet

\CDRSet \CDRSet {<key[=value] list>}
 \CDRSet {only description=true, font family=tt}
 \CDRSet {tag/default.code/font family=sf}

To set up the package. This is executed at least once at the end of the preamble. The unique mandatory argument of \CDRSet is a list of <key>[=<value>] items defined by the CDR@Set l3keys module.

10.1 CDR@Set l3keys module

```

887 \keys_define:nn { CDR@Set } {

```

● **only description** to typeset only the description section and ignore the implementation section.

```

888   only~description .choices:nn = { false, true, {} } {
889     \int_compare:nNnTF \l_keys_choice_int = 1 {
890       \prg_set_conditional:Nnn \CDR_if_only_description: { p, T, F, TF } { \prg_return_true: }
891     } {
892       \prg_set_conditional:Nnn \CDR_if_only_description: { p, T, F, TF } { \prg_return_false: }
893     }
894   },
895   only~description .initial:n = false,

```

● **python path** if automatic processing is not available, manually setting the path to the python utility is required. Giving a void path forces an automatic guess using which.

```

896   python~path .code:n = {
897     \str_set:Nn \l_CDR_str { #1 }
898     \exp_args:Nx \CDR_pygments_setup:n {
899       \lua_now:n { CDR:set_python_path('l_CDR_str') }
900     }
901   },
902 }

```

10.2 Branching

```
\CDR_if_only_description_p: * \CDR_if_only_description:TF {<true code>} {<false code>}
\CDR_if_only_description:TF *
```

Execute *<true code>* when only the description is expected, *<false code>* otherwise.
Implementation detail: the functions are defined as part of the CDR@Set l3keys module.

10.3 Implementation

```
\CDRBlock_preflight:n \CDR_set_preflight:n {<CDR@Set kv list>}
```

This is a preflight hook intended for testing. The default implementation does nothing.

```
903 \cs_new:Npn \CDR_set_preflight:n #1 { }

904 \NewDocumentCommand \CDRSet { m } {
905   \CDR@Debug{\string\CDRSet}
906   \CDR_set_preflight:n { #1 }
907   \keys_set_known:nnnN { CDR@Set } { #1 } { CDR@Set } \l_CDR_kv_clist
908   \clist_map_inline:nn {
909     __pygments, __pygments.block,
910     __tags, __engine, default.block, default.code, default,
911     __fancyvrb, __fancyvrb.frame, __fancyvrb.block, __fancyvrb.number, __fancyvrb.all
912   } {
913     \CDR_tag_keys_set_known:nN { ##1 } \l_CDR_kv_clist
914     \CDR@Debug{\string\CDRSet.1:##1/\l_CDR_kv_clist/ }
915   }
916   \CDR_tag_keys_set_known:nN { .. } \l_CDR_kv_clist
917   \CDR@Debug{\string\CDRSet.2:\CDR_tag_module:n { .. }+\l_CDR_kv_clist/ }
918   \CDR_tag_provide_from_kv:V \l_CDR_kv_clist
919   \CDR@Debug{\string\CDRSet.2a:\CDR_tag_module:n { .. }+\l_CDR_kv_clist/ }
920   \CDR_tag_keys_set_known:nN { .. } \l_CDR_kv_clist
921   \CDR@Debug{\string\CDRSet.3:\CDR_tag_module:n { .. }+\l_CDR_kv_clist/ }
922   \CDR_tag_keys_set:nV { default } \l_CDR_kv_clist
923   \CDR@Debug{\string\CDRSet.4:\CDR_tag_module:n { default } /\l_CDR_kv_clist/ }
924   \keys_define:nn { CDR@Set@tags } {
925     tags .code:n = {
926       \clist_set:Nx \g_CDR_tags_clist { ##1 }
927       \clist_remove_duplicates:N \g_CDR_tags_clist
928     },
929   }
930   \keys_set_known:nn { CDR@Set@tags } { #1 }
931   \ignorespaces
932 }
```

11 \CDRExport

```
\CDRExport \CDRExport {<key[=value] controls>}
```

The *<key>[=<value>]* controls are defined by CDR@Export l3keys module.

11.1 Storage

`\CDR_export_get_path:cc` ★ `\CDR_tag_export_path:cc` $\{\langle file\ name\rangle\}$ $\{\langle relative\ key\ path\rangle\}$

Internal: return a unique key based on the arguments. Used to store and retrieve values.

```

933 \cs_new:Npn \CDR_export_get_path:cc #1 #2 {
934   CDR @ export @ get @ #1 / #2
935 }
```

`\CDR_export_set:ccn` `\CDR_export_set:ccn` $\{\langle file\ name\rangle\}$ $\{\langle relative\ key\ path\rangle\}$ $\{\langle value\rangle\}$

`\CDR_export_set:Vcn`

`\CDR_export_set:VcV`

Store $\langle value\rangle$, which is further retrieved with the instruction `\CDR_get_get:cc` $\{\langle file\ name\rangle\}$ $\{\langle relative\ key\ path\rangle\}$. All the affectations are made at the global T_EX group level.

```

936 \cs_new_protected:Npn \CDR_export_gset:ccn #1 #2 #3 {
937   \cs_gset:cpn { \CDR_export_get_path:cc { #1 } { #2 } } { \exp_stop_f: #3 }
938 }
939 \cs_new_protected:Npn \CDR_export_gset:Vcn #1 {
940   \exp_args:NV
941   \CDR_export_gset:ccn { #1 }
942 }
943 \cs_new_protected:Npn \CDR_export_gset:VcV #1 #2 #3 {
944   \exp_args:NnV
945   \use:n {
946     \exp_args:NV \CDR_export_gset:ccn #1 { #2 }
947   } #3
948 }
```

`\CDR_export_if_exist:ccTF` ★ `\CDR_export_if_exist:ccTF` $\{\langle file\ name\rangle\}$ $\langle relative\ key\ path\rangle$ $\{\langle true\ code\rangle\}$ $\{\langle false\ code\rangle\}$

If the $\langle relative\ key\ path\rangle$ is known within $\langle file\ name\rangle$, the $\langle true\ code\rangle$ is executed, otherwise, the $\langle false\ code\rangle$ is executed.

```

949 \prg_new_conditional:Nnn \CDR_export_if_exist:cc { p, T, F, TF } {
950   \cs_if_exist:ctf { \CDR_export_get_path:cc { #1 } { #2 } } {
951     \prg_return_true:
952   } {
953     \prg_return_false:
954   }
955 }
```

`\CDR_export_get:cc` ★ `\CDR_export_get:cc` $\{\langle file\ name\rangle\}$ $\{\langle relative\ key\ path\rangle\}$

The property value stored for $\langle file\ name\rangle$ and $\langle relative\ key\ path\rangle$.

```

956 \cs_new:Npn \CDR_export_get:cc #1 #2 {
957   \CDR_export_if_exist:ccT { #1 } { #2 } {
958     \use:c { \CDR_export_get_path:cc { #1 } { #2 } }
959   }
960 }
```

```

\CDR_export_get:ccNTF \CDR_export_get:ccNTF {<file name>} {<relative key path>}
<tl var> {<true code>} {<false code>}

Get the property value stored for <file name> and <relative key path>, copy it to <tl
var>. Execute <true code> on success, <false code> otherwise.

961 \prg_new_protected_conditional:Nnn \CDR_export_get:ccN { T, F, TF } {
962   \CDR_export_if_exist:ccTF { #1 } { #2 } {
963     \tl_set:Nf #3 { \CDR_export_get:cc { #1 } { #2 } }
964     \prg_return_true:
965   } {
966     \prg_return_false:
967   }
968 }

```

11.2 Storage

\g_CDR_export_seq Global list of all the files to be exported.

```
969 \seq_new:N \g_CDR_export_seq
```

(End definition for \g_CDR_export_seq. This variable is documented on page ??.)

\l_CDR_file_tl Store the file name used for exportation, used as key in the above property list.

```
970 \tl_new:N \l_CDR_file_tl
```

(End definition for \l_CDR_file_tl. This variable is documented on page ??.)

\l_CDR_export_prop Used by CDR@Export l3keys module to temporarily store properties.

```
971 \prop_new:N \l_CDR_export_prop
```

(End definition for \l_CDR_export_prop. This variable is documented on page ??.)

11.3 CDR@Export l3keys module

No initial value is given for every key. An `__initialize` action will set the storage with proper initial values.

```
972 \keys_define:nn { CDR@Export } {
```

 **file=<name>** the output file name, must be provided otherwise an error is raised.

```
973   file .tl_set:N = \l_CDR_file_tl,
974   file .value_required:n = true,
```

 **tags=<tags comma list>** the list of tags. No exportation when this list is void. Initially empty.

```
975   tags .code:n = {
976     \clist_set:Nx \l_CDR_clist { #1 }
977     \clist_remove_duplicates:N \l_CDR_clist
978     \prop_put:NVV \l_CDR_export_prop \l_keys_key_str \l_CDR_clist
979   },
980   tags .value_required:n = true,
```

● **lang** one of the languages pygments is aware of. Initially `tex`.

```
981 lang .code:n = {
982   \prop_put:NVn \l_CDR_export_prop \l_keys_key_str { #1 }
983 },
984 lang .value_required:n = true,
```

● **preamble**=*<preamble content>* the added preamble. Initially empty.

```
985 preamble .code:n = {
986   \prop_put:NVn \l_CDR_export_prop \l_keys_key_str { #1 }
987 },
988 preamble .value_required:n = true,
```

● **preamble file**=*<preamble file path>* when provided, the preamble is the content of the file at the given path, overriding the `preamble` option. `escapeinside` applies. Initially empty.

```
989 preamble~file .code:n = {
990   \prop_put:NVn \l_CDR_export_prop \l_keys_key_str { #1 }
991 },
992 preamble~file .value_required:n = true,
```

● **postamble**=*<postamble content>* the added postamble. Initially empty.

```
993 postamble .code:n = {
994   \prop_put:NVn \l_CDR_export_prop \l_keys_key_str { #1 }
995 },
996 postamble .value_required:n = true,
```

● **postamble file**=*<postamble file path>* when provided, the postamble is the content of the file at the given path, overriding the `postamble` option. `escapeinside` applies. Initially empty.

```
997 postamble~file .code:n = {
998   \prop_put:NVn \l_CDR_export_prop \l_keys_key_str { #1 }
999 },
1000 postamble~file .value_required:n = true,
```

● **escapeinside**=*<2 delimiters>* When provided, the text of the preamble or the postamble enclosed between the delimiters is interpreted as L^AT_EX instructions. Quite any unicode character is permitted, except the caret `^`. Useful to insert the current date. Initially empty.

```
1001 escapeinside .code:n = {
1002   \prop_put:NVn \l_CDR_export_prop \l_keys_key_str { #1 }
1003 },
1004 escapeinside .value_required:n = true,
```

● **raw**[*=true|false*] true to remove any additional material, false otherwise. Initially false.

```

1005 raw .choices:nn = { false, true, {} } {
1006   \prop_put:NVx \l_CDR_export_prop \l_keys_key_str {
1007     \int_compare:nNnTF
1008       \l_keys_choice_int = 1 { false } { true }
1009   }
1010 },

```

 **once[=true|false]** true to remove any additional material, false otherwise. Initially true.

```

1011 once .choices:nn = { false, true, {} } {
1012   \prop_put:NVx \l_CDR_export_prop \l_keys_key_str {
1013     \int_compare:nNnTF
1014       \l_keys_choice_int = 1 { false } { true }
1015   }
1016 },

```

 **__initialize** Properly initialize the local property storage.

```

1017 __initialize .code:n = \prop_clear:N #1,
1018 __initialize .default:n = \l_CDR_export_prop,
1019 }

```

11.4 Implementation

\CDRPercent To include a % or a # character in the preamble or the postamble below. Must be escaped.

\CDRHash *(End definition for \CDRPercent and \CDRHash. These variables are documented on page ??.)*

```

1020 \str_set_eq:NN \CDRPercent \c_percent_str
1021 \str_set_eq:NN \CDRHash \c_hash_str

1022 \str_set_eq:NN \CDRPercent \c_percent_str
1023 \str_set_eq:NN \CDRHash \c_hash_str
1024 \NewDocumentCommand \CDRExport { m } {
1025   \keys_set:nn { CDR@Export } { __initialize }
1026   \keys_set:nn { CDR@Export } { #1 }
1027   \tl_if_empty:NTF \l_CDR_file_tl {
1028     \PackageWarning
1029       { coder }
1030       { Missing~export~key~‘file’ }
1031   } {
1032     \CDR_export_gset:VcV \l_CDR_file_tl { file } \l_CDR_file_tl
1033     \prop_map_inline:Nn \l_CDR_export_prop {
1034       \CDR_export_gset:Vcn \l_CDR_file_tl { ##1 } { ##2 }
1035     }

```

The list of tags must not be empty, raise an error otherwise. Records the list in `\g_CDR_tags_clist`, it will be the default list of forthcoming code blocks.

```

1036   \prop_get:NnNTF \l_CDR_export_prop { tags } \l_CDR_clist {
1037     \clist_set_eq:NN \g_CDR_tags_clist \l_CDR_clist
1038     \clist_if_empty:NF \l_CDR_clist {
1039       \clist_remove_duplicates:N \g_CDR_tags_clist
1040       \clist_put_left:NV \g_CDR_all_tags_clist \l_CDR_clist
1041       \clist_remove_duplicates:N \g_CDR_all_tags_clist

```

If a `lang` is given, forwards the declaration to all the code chunks tagged within `\g_CDR_tags_clist`.

```

1042     \CDR_export_get:ccNT { \l_CDR_file_tl } { lang } \l_CDR_tl {
1043     \clist_map_inline:Nn \g_CDR_tags_clist {
1044     \CDR_tag_set:ccV { ##1 } { lang } \l_CDR_tl
1045     }
1046     }
1047     }
1048     \seq_put_left:NV \g_CDR_export_seq \l_CDR_file_tl
1049     \seq_remove_duplicates:N \g_CDR_export_seq
1050   } {
1051     \CDR_export_if_exist:ccF { \l_CDR_file_tl } { tags } {
1052     \PackageWarning
1053     { coder }
1054     { Missing~export~key~‘tags’ }
1055     }
1056   }
1057 }
1058 \ignorespaces
1059 }

```

`\l_CDR_export_tl` Scratch variable.

```

1060 \tl_new:N \l_CDR_export_tl

```

(End definition for `\l_CDR_export_tl`. This variable is documented on page ??.)

Files are created at the end of the typesetting process. We define a separate macro to be used for testing purposes.

```

12 Style

pygments, through coder-tool.py, creates style commands, but the storage is managed on the L^AT_EX side by coder.sty. This is a L^AT_EX style API.

<code>\CDR@StyleDefine</code>	<code>\CDR@StyleDefine {<pygments style name>} {<definitions>}</code>
-------------------------------	---

Define the definitions for the given <pygments style name>.

```

1203 \cs_set:Npn \CDR@StyleDefine #1 {
1204   \tl_gset:cn { g_CDR@Style/#1 }
1205 }

```

<code>\CDR@StyleUse</code>	<code>\CDR@StyleUse {<pygments style name>}</code>
<code>CDR@StyleUseTag</code>	<code>\CDR@StyleUseTag</code>

Use the definitions for the given <pygments style name>. No safe check is made. The `\CDR@StyleUseTag` version finds the <pygments style name> from the context.

```

1206 \cs_set:Npn \CDR@StyleUse #1 {
1207   \tl_use:c { g_CDR@Style/#1 }
1208 }
1209 \cs_set:Npn \CDR@StyleUseTag {
1210   \CDR@StyleUse { \CDR_tag_get:c { style } }
1211 }

```

<code>\CDR@StyleExist</code>	<code>\CDR@StyleExist {<pygments style name>} {<true code>} {<false code>}</code>
------------------------------	---

Execute <true code> if a style exists with that given name, <false code> otherwise.

```

1212 \prg_new_conditional:Nnn \CDR@StyleIfExist:c { TF } {
1213   \tl_if_exist:cTF { g_CDR@Style/#1 } {
1214     \prg_return_true:
1215   } {
1216     \prg_return_false:
1217   }
1218 }
1219 \cs_set_eq:NN \CDR@StyleIfExist \CDR@StyleIfExist:cTF

```

13 Creating display engines

13.1 Utilities

<code>\CDRCode_engine:c</code>	★	<code>\CDRCode_engine:c {<engine name>}</code>
<code>\CDRCode_engine:V</code>	★	<code>\CDRBlock_engine:c {<engine name>}</code>
<code>\CDRBlock_engine:c</code>	★	<code>\CDRCode_engine:c</code> builds a command sequence name based on <code><engine name></code> . <code>\CDRBlock_engine:c</code>
<code>\CDRBlock_engine:V</code>	★	builds an environment name based on <code><engine name></code> .

```

1220 \cs_new:Npn \CDRCode_engine:c #1 {
1221   CDR@colored/code/#1:nn
1222 }
1223 \cs_new:Npn \CDRBlock_engine:c #1 {
1224   CDR@colored/block/#1
1225 }
1226 \cs_new:Npn \CDRCode_engine:V {
1227   \exp_args:NV \CDRCode_engine:c
1228 }
1229 \cs_new:Npn \CDRBlock_engine:V {
1230   \exp_args:NV \CDRBlock_engine:c
1231 }
```

<code>\CDRCode_options:c</code>	★	<code>\CDRCode_options:c {<engine name>}</code>
<code>\CDRCode_options:V</code>	★	<code>\CDRBlock_options:c {<engine name>}</code>
<code>\CDRBlock_options:c</code>	★	<code>\CDRCode_options:c</code> builds a command sequence name based on <code><engine name></code> used
<code>\CDRBlock_options:V</code>	★	to store the comma list of key value options. <code>\CDRBlock_options:c</code> builds a command

sequence name based on `<engine name>` used to store the comma list of key value options.

```

1232 \cs_new:Npn \CDRCode_options:c #1 {
1233   CDR@colored/code~options/#1:nn
1234 }
1235 \cs_new:Npn \CDRBlock_options:c #1 {
1236   CDR@colored/block~options/#1
1237 }
1238 \cs_new:Npn \CDRCode_options:V {
1239   \exp_args:NV \CDRCode_options:c
1240 }
1241 \cs_new:Npn \CDRBlock_options:V {
1242   \exp_args:NV \CDRBlock_options:c
1243 }
```

<code>\CDRCode_options_use:c</code>	★	<code>\CDRCode_options_use:c {<engine name>}</code>
<code>\CDRCode_options_use:V</code>	★	<code>\CDRBlock_options_use:c {<engine name>}</code>
<code>\CDRBlock_options_use:c</code>	★	<code>\CDRCode_options_use:c</code> builds a command sequence name based on <code><engine name></code>
<code>\CDRBlock_options_use:V</code>	★	and use it. <code>\CDRBlock_options:c</code> builds a command sequence name based on <code><engine</code>

`name>` and use it.

```

1244 \cs_new:Npn \CDRCode_options_use:c #1 {
1245   \CDRCode_if_options:cT { #1 } {
1246     \use:c { \CDRCode_options:c { #1 } }
```

```

1247 }
1248 }
1249 \cs_new:Npn \CDRBlock_options_use:c #1 {
1250   \CDRBlock_if_options:cT { #1 } {
1251     \use:c { \CDRBlock_options:c { #1 } }
1252   }
1253 }
1254 \cs_new:Npn \CDRCode_options_use:V {
1255   \exp_args:NV \CDRCode_options_use:c
1256 }
1257 \cs_new:Npn \CDRBlock_options_use:V {
1258   \exp_args:NV \CDRBlock_options_use:c
1259 }

```

`\l_CDR_engine_tl` Storage for an engine name.

```

1260 \tl_new:N \l_CDR_engine_tl

```

(End definition for `\l_CDR_engine_tl`. This variable is documented on page ??.)

`\CDRGetOption` `\CDRGetOption {<relative key path>}`

Returns the value given to `\CDRCode` command or `CDRBlock` environment for the `<relative key path>`. This function is only available during `\CDRCode` execution and inside `CDRBlock` environment.

13.2 Implementation

<code>\CDRCodeEngineNew</code>	<code>\CDRCodeEngineNew {<engine name>}{<engine body>}</code>
<code>\CDRCodeEngineRenew</code>	<code>\CDRCodeEngineRenew{<engine name>}{<engine body>}</code>

`<engine name>` is a non void string, once expanded. The `<engine body>` is a list of instructions which may refer to the first argument as `#1`, which is the value given for key `<engine name>` engine options, and the second argument as `#2`, which is the colored code.

```

1261 \cs_new:Npn \CDR_forbidden:n #1 {
1262   \group_begin:
1263   \CDR_local_inherit:n { __no_tag, __no_engine }
1264   \CDR_local_set_known:nN { #1 } \l_CDR_kv_clist
1265   \group_end:
1266 }
1267 \NewDocumentCommand \CDRCodeEngineNew { mO{}m } {
1268   \exp_args:Nx
1269   \tl_if_empty:nTF { #1 } {
1270     \PackageWarning
1271       { coder }
1272       { The~engine~cannot~be~void. }
1273   } {
1274     \CDR_forbidden:n { #2 }
1275     \cs_set:cpn { \CDRCode_options:c { #1 } } { \exp_not:n { #2 } }
1276     \cs_new:cpn { \CDRCode_engine:c {#1} } ##1 ##2 {
1277       \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
1278       #3

```

```

1279     }
1280     \ignorespaces
1281   }
1282 }

```

\CDR_forbidden_keys:n \CDR_forbidden_keys:n {⟨key[=value] items⟩}

Raise an error if one of `tags` and `engine` keys is provided in ⟨key[=value] items⟩. These keys are forbidden for the coder options associate to an engine.

```

1283 \cs_new:Npn \CDR_forbidden_keys:n #1 {
1284   \group_begin:
1285   \CDR_local_inherit:n { __no_tags, __no_engine }
1286   \CDR_local_set_known:nN { #1 } \l_CDR_kv_clist
1287   \group_end:
1288 }

1289 \NewDocumentCommand \CDRCodeEngineRenew { mO{}m } {
1290   \exp_args:Nx
1291   \tl_if_empty:nTF { #1 } {
1292     \PackageWarning
1293       { coder }
1294       { The~engine~cannot~be~void. }
1295     \use_none:n
1296   } {
1297     \cs_if_exist:cTF { \CDRCode_engine:c { #1 } } {
1298       \CDR_forbidden:n { #2 }
1299       \cs_set:cpn { \CDRCode_options:c { #1 } } { \exp_not:n { #2 } }
1300       \cs_set:cpn { \CDRCode_engine:c { #1 } } ##1 ##2 {
1301         \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
1302         #3
1303       }
1304     } {
1305       \PackageWarning
1306         { coder }
1307         { No~code~engine~#1.}
1308     }
1309     \ignorespaces
1310   }
1311 }

```

\CDR@CodeEngineApply \CDR@CodeEngineApply {⟨source⟩}

Get the code engine and apply it to the given ⟨source⟩. When the code engine is not recognized, an error is raised. *Implementation detail:* the argument is parsed by the last macro.

```

1312 \cs_new_protected:Npn \CDR@CodeEngineApply {
1313   \CDRCode_if_engine:cF { \CDR_tag_get:c { engine } } {
1314     \PackageError
1315       { coder }
1316       { \CDR_tag_get:c { engine }~code~engine~unknown,~replaced~by~‘default’ }
1317       { See~\CDRCodeEngineNew~in~the~coder~manual }

```

```

1318 \CDR_tag_set:cn { engine } { default }
1319 }
1320 \CDR_tag_get:c { format }
1321 \exp_args:Nnx
1322 \use:c { \CDRCode_engine:c { \CDR_tag_get:c { engine } } } {
1323 \CDR_tag_get:c { \CDR_tag_get:c { engine }-engine-options },
1324 \CDR_tag_get:c { engine-options }
1325 }
1326 }

```

<code>\CDRBlockEngineNew</code> <code>\CDRBlockEngineRenew</code>	<pre> \CDRBlockEngineNew {<engine name>} [<options>] {<begin instructions>} {<end instructions>} \CDRBlockEngineRenew {<engine name>} [<options>] {<begin instructions>} {<end instructions>} </pre>
--	--

Create a L^AT_EX environment uniquely named after `<engine name>`, which must be a non void string once expanded. The `<begin instructions>` and `<end instructions>` are lists of instructions which may refer to the name as #1, which is the value given to CDRBlock environment for key `<engine name>` engine options. Various options are available with the `\CDRGetOption` function. *Implementation detail:* the fourth argument is parsed by `\NewDocumentEnvironment`.

```

1327 \NewDocumentCommand \CDRBlockEngineNew { mO{}m } {
1328 \CDR_forbidden:n { #2 }
1329 \cs_set:cpn { \CDRBlock_options:c { #1 } } { \exp_not:n { #2 } }
1330 \NewDocumentEnvironment { \CDRBlock_engine:c { #1 } } { m } {
1331 \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
1332 #3
1333 }
1334 }

1335 \NewDocumentCommand \CDRBlockEngineRenew { mO{}m } {
1336 \tl_if_empty:nTF { #1 } {
1337 \PackageError
1338 { coder }
1339 { The~engine~cannot~be~void. }
1340 { See~\string\CDRBlockEngineNew~in~the~coder~manual }
1341 \use_none:n
1342 } {
1343 \cs_if_exist:cTF { \CDRBlock_engine:c { #1 } } {
1344 \CDR_forbidden:n { #2 }
1345 \cs_set:cpn { \CDRBlock_options:c { #1 } } { \exp_not:n { #2 } }
1346 \RenewDocumentEnvironment { \CDRBlock_engine:c { #1 } } { m } {
1347 \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
1348 #3
1349 }
1350 } {
1351 \PackageError
1352 { coder }
1353 { No~block~engine~#1.}
1354 { See~\string\CDRBlockEngineNew~in~the~coder~manual }
1355 }
1356 }
1357 }

```

<code>\CDRBlock_engine_begin:</code>	<code>\CDRBlock_engine_begin:</code>
<code>\CDR@Block_engine_end:</code>	<code>\CDRBlock_engine_end:</code>

After some checking, begin the engine display environment with the proper options. The second command closes the environment. This does not start a new group.

```

```
1418 \prg_new_conditional:Nnn \CDRCode_if_options:c { p, T, F, TF } {
1419   \cs_if_exist:cTF { \CDRCode_options:c { #1 } } {
1420     \prg_return_true:
1421   } {
1422     \prg_return_false:
1423   }
1424 }
1425 \prg_new_conditional:Nnn \CDRCode_if_options:V { p, T, F, TF } {
1426   \cs_if_exist:cTF { \CDRCode_options:V #1 } {
1427     \prg_return_true:
1428   } {
1429     \prg_return_false:
1430   }
1431 }
```

`\CDRBlock_if_options:cTF` ★ `\CDRBlock_if_options:c {<engine name>} {<true code>} {<false code>}`

If there exists a block options with the given *<engine name>*, execute *<true code>*, otherwise, execute *<false code>*.

```
1432 \prg_new_conditional:Nnn \CDRBlock_if_options:c { p, T, F, TF } {
1433   \cs_if_exist:cTF { \CDRBlock_options:c { #1 } } {
1434     \prg_return_true:
1435   } {
1436     \prg_return_false:
1437   }
1438 }
1439 \prg_new_conditional:Nnn \CDRBlock_if_options:V { p, T, F, TF } {
```

```

1440 \cs_if_exist:cTF { \CDRBlock_options:V #1 } {
1441   \prg_return_true:
1442 } {
1443   \prg_return_false:
1444 }
1445 }

```

13.3 Default code engine

The default code engine does nothing special and forwards its argument as is.

```

1446 \CDRCodeEngineNew { default } { #2 }

```

13.4 efbox code engine

```

1447 \AtBeginDocument {
1448   \@ifpackageloaded{efbox} {
1449     \CDRCodeEngineNew {efbox} {
1450       \efbox[#1]{#2}
1451     }
1452   } {}
1453 }

```

13.5 Block mode default engine

```

1454 \CDRBlockEngineNew {default} {
1455 } {
1456 }

```

13.6 tcolorbox related engine

If the tcolorbox is loaded, related code and block engines are available.

```

1457 \AtBeginDocument {
1458   \@ifpackageloaded{tcolorbox} {
1459     \CDRBlockEngineNew {tcbox} {
1460       \begin{tcolorbox}[#1]
1461     } {
1462       \end{tcolorbox}
1463     }
1464   } {}
1465 }

```

14 \CDRCode function

14.1 API

\CDR@Sp

\CDR@Sp

Private method to eventually make the space character visible using \FancyVerbSpace base on `showspaces` value.

```

1466 \cs_new:Npn \CDR@DefinePygSp {
1467   \CDR_if_tag_truthy:cTF { showspaces } {
1468     \cs_set:Npn \CDR@Sp {{\FancyVerbSpace}}
1469   } {
1470     \cs_set_eq:NN \CDR@Sp \space
1471   }
1472 }

```

\CDRCode \CDRCode{<key[=value]>}<delimiter><code><same delimiter>

Public method to declare inline code.

14.2 Storage

\l_CDR_tag_tl To store the tag given.

```

1473 \tl_new:N \l_CDR_tag_tl

```

(End definition for \l_CDR_tag_tl. This variable is documented on page ??.)

14.3 `__code l3keys` module

This is the module used to parse the user interface of the `\CDRCode` command.

```

1474 \CDR_tag_keys_define:nn { __code } {

```

 **tag=<name>** to use the settings of the already existing named tag to display.

```

1475   tag .tl_set:N = \l_CDR_tag_tl,
1476   tag .value_required:n = true,

```

 **engine options=<engine options>** options forwarded to the engine. They are appended to the options given with key `<engine name>` engine options.

```

1477   engine-options .code:n = \CDR_tag_set:,
1478   engine-options .value_required:n = true,

```

 **__initialize** initialize

```

1479   __initialize .meta:n = {
1480     tag = default,
1481     engine~options = ,
1482   },
1483   __initialize .value_forbidden:n = true,
1484 }

```

14.4 Implementation

```

1485 \NewDocumentCommand \CDRCode { 0{ } } {
1486   \group_begin:
1487   \prg_set_conditional:Nnn \CDR_if_block: { p, T, F, TF } {
1488     \prg_return_false:
1489   }
1490   \clist_set:Nn \l_CDR_kv_clist { #1 }
1491   \CDRCode_tags_setup:N \l_CDR_kv_clist
1492   \CDRCode_engine_setup:N \l_CDR_kv_clist
1493   \CDR_local_inherit:n {
1494     __code, default.code, __pygments, default,
1495   }
1496   \CDR_local_set_known:N \l_CDR_kv_clist
1497   \CDR_tag_provide_from_kv:V \l_CDR_kv_clist
1498   \CDR_local_set_known:N \l_CDR_kv_clist
1499   \CDR_local_inherit:n {
1500     __fancyvrb,
1501   }
1502   \CDR_local_set:V \l_CDR_kv_clist
1503   \CDRCode:n
1504 }

```

<code>\CDRCode_tags_setup:N</code>	<code>\CDRCode_tags_setup:N {<clist var>}</code>
<code>\CDRCode_engine_setup:N</code>	<code>\CDRCode_engine_setup:N {<clist var>}</code>

Utility to setup the tags, the tag inheritance tree and the engine. When not provided explicitly with the `tags=...` user interface, a code chunk will have the list of tags stored in `\g_CDR_tags_clist` by last `\CDRExport`, `\CDRSet` or `\CDRBlock` environment. At least one tag must be provided, either implicitly or explicitly.

```

1505 \cs_new_protected_nopar:Npn \CDRCode_tags_setup:N #1 {
1506 \CDR@Debug{\string \CDRCode_tags_setup:N, \string #1 }
1507   \CDR_local_inherit:n { __tags }
1508   \CDR_local_set_known:N #1
1509   \CDR_if_tag_exist_here:ccT { __local } { tags } {
1510     \CDR_tag_get:cN { tags } \l_CDR_clist
1511     \clist_if_empty:NF \l_CDR_clist {
1512       \clist_gset_eq:NN \g_CDR_tags_clist \l_CDR_clist
1513     }
1514   }
1515   \clist_if_empty:NT \g_CDR_tags_clist {
1516     \PackageWarning
1517       { coder }
1518       { No~(default)~tags~provided. }
1519   }
1520 \CDR@Debug {CDRCode_tags_setup:N\space\g_CDR_tags_clist}

```

Setup the inheritance tree for the `\CDR_tag_get:...` related functions.

```

1521 \CDR_get_inherit:f {
1522   \g_CDR_tags_clist,
1523   __tags, __engine, __code, default.code, __pygments, default,
1524 }
1525 }

```

Now setup the engine options if any.

```

1526 \cs_new_protected_nopar:Npn \CDRCode_engine_setup:N #1 {
1527 \CDR@Debug{\string \CDRCode_engine_setup:N, \string #1}
1528 \CDR_local_inherit:n { __engine }
1529 \CDR_local_set_known:N #1
1530 \CDR_tag_get:cNT { engine } \l_CDR_tl {
1531 \clist_put_left:Nx #1 { \CDRCode_options_use:V \l_CDR_tl }
1532 }
1533 }

```

\CDRCode:n \CDRCode:n <delimiter>

Main utility used by \CDRCode. The main tricky part is that we must collect the <key[=value]> items and feed \FV@KeyValues with them in the aftersave handler.

```

1534 \cs_new_protected_nopar:Npn \CDRCode:n #1 {
1535   \bool_if:nTF { \CDR_has_pygments_p: && \CDR_if_tag_truthy_p:c {pygments}} {
1536     \cs_set:Npn \CDR@StyleUseTag {
1537       \CDR@StyleUse { \CDR_tag_get:c { style } }
1538       \cs_set_eq:NN \CDR@StyleUseTag \prg_do_nothing:
1539     }
1540     \DefineShortVerb { #1 }

15 CDRBlock environment

CDRBlock `\begin{CDRBlock}{<key[=value] list>} ... \end{CDRBlock}`

15.1 __block l3keys module

This module is used to parse the user interface of the CDRBlock environment.

```
1612 \CDR_tag_keys_define:nn { __block } {
```

 **no export**[=true|false] to ignore this code chunk at export time.

```

1613 no-export .code:n = \CDR_tag_boolean_set:x { #1 },
1614 no-export .default:n = true,

🔴 no export format=<format commands> a format appended to format, tags format
    and numbers format when no export is true.. Initially empty.

1615 no-export~format .code:n = \CDR_tag_set:,

🔴 dry numbers[=true|false] Initially false.

1616 dry~numbers .code:n = \CDR_tag_boolean_set:x { #1 },
1617 dry~numbers .default:n = true,

🔴 test[=true|false] whether the chunk is a test,

1618 test .code:n = \CDR_tag_boolean_set:x { #1 },
1619 test .default:n = true,

🔴 engine options=<engine options> options forwarded to the engine. They are ap-
    pended to the options given with key <engine name> engine options. Mainly
    a convenient user interface shortcut.

1620 engine-options .code:n = \CDR_tag_set:,
1621 engine-options .value_required:n = true,

🔴 __initialize initialize

1622 __initialize .meta:n = {
1623     no-export = false,
1624     no-export~format = ,
1625     dry~numbers = false,
1626     test = false,
1627     engine~options = ,
1628 },
1629 __initialize .value_forbidden:n = true,

1630 }

```

15.2 Implementation

15.2.1 Storage

`__start` For the line numbering, these are loop integer controls. The lines displayed are in the
`__step` range `__mini`; `__maxi`, relative to the L^AT_EX source block where they are defined.
`__last` `__start` for the first index
`__mini` `__step` for the step, defaults to 1
`__maxi` `__last` for the last index, included

```

1631 \CDR_int_new:cn { __start } { 0 }
1632 \CDR_int_new:cn { __step } { 0 }
1633 \CDR_int_new:cn { __last } { 0 }
1634 \CDR_int_new:cn { __mini } { 0 }
1635 \CDR_int_new:cn { __maxi } { 0 }

```

(End definition for `__start` and others.)

15.2.2 Preparation

We start by saving some `fancyvrb` macros that we further want to extend. The unique mandatory argument of these macros will eventually be recorded to be saved later on.

```
1636 \clist_map_inline:nn { i, ii, iii, iv } {
1637   \cs_set_eq:cc { CDR@ListProcessLine@ #1 } { FV@ListProcessLine@ #1 }
1638 }
```

`\CDRBlock_preflight:n` `\CDRBlock_preflight:n {(CDR@Block kv list)}`

This is a preflight hook intended for testing. The default implementation does nothing.

```
1639 \cs_new:Npn \CDRBlock_preflight:n #1 { }
```

15.2.3 Main environment

`\l_CDR_vrb_seq` All the lines are scanned and recorded before they are processed.

(End definition for `\l_CDR_vrb_seq`. This variable is documented on page ??.)

```
1640 \seq_new:N \l_CDR_vrb_seq
```

`\FVB@CDRBlock` `fancyvrb` helper to begin the `CDRBlock` environment.

```
1641 \cs_new:Npn \FVB@CDRBlock {
1642   \@bsphack
1643   \exp_args:NV \CDRBlock_preflight:n \FV@KeyValues
1644   \begingroup
1645   \lua_now:n {
1646     CDR.synctex_tag = tex.get_synctex_tag();
1647     CDR.synctex_line = tex.inputlineno;
1648     tex.set_synctex_mode(1)
1649   }
1650   \seq_clear:N \l_CDR_vrb_seq
1651   \cs_set_protected_nopar:Npn \FV@ProcessLine ##1 {
1652     \seq_put_right:Nn \l_CDR_vrb_seq { ##1 }
1653   }
1654   \FV@Scan
1655 }
```

`\FVE@CDRBlock` `fancyvrb` helper to end the `CDRBlock` environment.

```
1656 \regex_new:N \l_CDR_regex
1657 \cs_generate_variant:Nn \regex_set:Nn { Nx, NV }
1658 \cs_new:Npn \FVE@CDRBlock {
1659   \CDRBlock_setup:
```

We export all the lines if requested except what was escaped to L^AT_EX. As we use regular expressions, we must take care of characters with a special meaning. For that purpose we enclose between square brackets, this is why the carret \wedge is not allowed, as it would negate the class.

If `texcomment` has been set and the language is not `tex`, for each line, only the part before the first `%` will be exported.

If `texcomment` has not been set, and `escapeinside` has been provided with two characters, then what is inside the delimiter and the delimiters is not exported.

Actually, no alternate possibility is offered.

```

1660 \CDR@Debug{\string\FVE@CDRBlock\space 1}
1661 \CDR_if_no_export:F {
1662   \seq_map_inline:Nn \l_CDR_vrb_seq {
1663     \tl_set:Nn \l_CDR_tl { ##1 }
1664     \lua_now:n { CDR:record_line('l_CDR_tl') }
1665   }
1666 }

```

Line numbering is not delegated to `fancyvrb`, the main difficulty is to manage the `__mini` and `__maxi` values because they can be defined either explicitly by a number or implicitly by a regular expression. Let us start by the minimum index.

```

1667 \CDR_int_set:cn { __mini } { 1 }
1668 \CDR_tag_get:cNT { firstline } \l_CDR_tl {
1669   \tl_if_empty:NF \l_CDR_tl {
1670     \exp_args:NNV
1671     \regex_match:NnTF \c_CDR_int_regex \l_CDR_tl {
1672       \CDR_int_set:cn { __mini } { \l_CDR_tl }
1673     } {
1674       \regex_set:NV \l_CDR_regex \l_CDR_tl
1675       \seq_map_indexed_inline:Nn \l_CDR_vrb_seq {
1676         \regex_match:NnT \l_CDR_regex { ##2 } {
1677           \CDR_int_set:cn { __mini } { ##1 }
1678         }
1679       }
1680     }
1681   }
1682 }
1683 }

```

Let us go now for the maximum index.

```

1684 \CDR_int_set:cn { __maxi } { \seq_count:N \l_CDR_vrb_seq }
1685 \CDR_tag_get:cNT { lastline } \l_CDR_tl {
1686   \tl_if_empty:NF \l_CDR_tl {
1687     \exp_args:NNV
1688     \regex_match:NnTF \c_CDR_int_regex \l_CDR_tl {
1689       \CDR_int_set:cn { __maxi } { \l_CDR_tl }
1690     } {
1691       \regex_set:NV \l_CDR_regex \l_CDR_tl
1692       \seq_map_indexed_inline:Nn \l_CDR_vrb_seq {
1693         \CDR_int_compare:cNnF { __mini } > { ##1 } {
1694           \regex_match:NnT \l_CDR_regex { ##2 } {
1695             \CDR_int_set:cn { __maxi } { ##1 }
1696           }
1697         }
1698       }
1699     }
1700   }
1701 }

```

```

1697     }
1698   }
1699 }
1700 }
1701 }
1702 }

1738 \CDR@Debug{\string \CDRBlock_setup:.KV1:\l_CDR_kv_clist}

```

Now `\FV@KeyValues` is meant to contains only keys related to `fancyvrb` but we still need to filter them out. If the display engine is not the default one, we catch any key related to framing. Anyways, we catch keys related to numbering because line numbering is completely performed by `coder`.

```

1739 \CDR_local_inherit:n {
1740   \CDR_if_tag_eq:cnF { engine } { default } {

```

```

1741     __fancyvrb.frame,
1742   },
1743   __fancyvrb.number,
1744 }
1745 \CDR_local_set_known:N \FV@KeyValues
1746 \CDR@Debug{\string \CDRBlock_setup:, \FV@KeyValues}

```

These keys are read without removing them later and eventually forwarded to fancyvrb through its natural \FV@UseKeyValues mechanism.

```

1747 \CDR_local_inherit:n {
1748   __fancyvrb.block,
1749   __fancyvrb,

2132   }
2133 }

```

\CDR_line:nnn \CDR_line:nnn {<CDR@Line kv list>} {<line index>} {<line content>}

This is the very first command called when typesetting. Some setup are made for line numbering, in particular the `\CDR_if_visible_at_index:n...` family is set here. The first line must read `\CDR@Line[last=...]{1}{...}`, be it input from any `...pyg.tex` files or directly, like for `fancyvrb` usage. The line index refers to the lines in the source, what is displayed is a line number.

```

2134 \keys_define:nn { CDR@Line } {
2135   last .code:n = \CDR_int_set:cn { __last } { #1 },
2136 }
2137 \cs_new:Npn \CDR_line:nnn [ #1 ] #2 {
2138   \CDR@Debug {\string\CDR_line:nnn}
2139   \keys_set:nn { CDR@Line } { #1 }
2140   \CDR_if_number_on:TF {
2141     \CDR_int_set:cn { __n } { 1 }
2142     \CDR_int_set:cn { __i } { 1 }

```

Set the first line number.

```

2143 \CDR_int_set:cn { __start } { 1 }
2144 \CDR_if_tag_eq:cnTF { firstnumber } { last } {
2145 \clist_map_inline:Nn \g_CDR_tags_clist {
2146 \clist_map_break:n {
2147 \CDR_int_set:cc { __start } { ##1 }
2148 \CDR@Debug {START: ##1=\CDR_int_use:c { ##1 } }
2149 }
2150 }
2151 } {
2152 \CDR_if_tag_eq:cnF { firstnumber } { auto } {
2153 \CDR_int_set:cn { __start } { \CDR_tag_get:c { firstnumber } }
2154 }
2155 }

```

Make `__last` absolute only after defining the `\CDR_if_number_single...` conditionals.

```

2156 \CDR_set_conditional:Nn \CDR_if_number_single: {
2157 \CDR_int_compare_p:cNn { __mini } = { \CDR_int:c { __maxi } }
2158 }
2159 \CDR@Debug{***** TEST: \CDR_if_number_single:TF { SINGLE } { MULTI } }
2160 \CDR_int_add:cn { __last } { \CDR_int:c { __start } - 1 }
2161 \CDR_int_set:cn { __step } { \CDR_tag_get:c { stepnumber } }
2162 \CDR@Debug {CDR_line:nnn:START/STEP/LAST=\CDR_int_use:c { __start }/\CDR_int_use:c { __step } /\

```

```

\CDR_if_visible_at_index_p:n * \CDR_if_visible_at_index:nTF {<relative line number>} {<true code>}
\CDR_if_visible_at_index:nTF * {<false code>}

```

The `<relative line number>` is the first braced token after `\CDR@Line` in the various colored `...pyg.tex` files. Execute `<true code>` if the `<relative line number>` is visible, `<false code>` otherwise. The `<relative line number>` visibility depends on the value relative to first number and the step. This is relevant only when line numbering is enabled. Some setup are made for line numbering, in particular the `\CDR_if_visible_at_index:n...` family is set here.

```

2163 \CDR_set_conditional_alt:Nn \CDR_if_visible_at_index:n {
2164 \CDR_if_number_visible_p:n { ##1 + \CDR_int:c { __start } - (#2) }

15.2.6 Utilities

This is put aside for better clarity.

<code>\CDR_if_middle_column:</code>	<code>\CDR_int_if_middle_column:TF {<true code>} {<false code>}</code>
<code>\CDR_if_right_column:</code>	<code>\CDR_int_if_right_column:TF {<true code>} {<false code>}</code>

Execute *<true code>* when in the middle or right column, *<false code>* otherwise.

```

2363 \prg_set_conditional:Nnn \CDR_if_middle_column: { p, T, F, TF } { \prg_return_false: }
2364 \prg_set_conditional:Nnn \CDR_if_right_column: { p, T, F, TF } { \prg_return_false: }

```

Various utility conditionals: their purpose is to clarify the code. They are available in the `CDRBlock` environment only.

<code>\CDR_if_tags_visible_p:n *</code>	<code>\CDR_if_tags_visible:nTF {<left right>} {<true code>} {<false code>}</code>
<code>\CDR_if_tags_visible:nTF *</code>	

Whether the tags should be visible, at the left or at the right.

```

2365 \prg_set_conditional:Nnn \CDR_if_tags_visible:n { p, T, F, TF } {
2366   \bool_if:nTF {
2367     ( \CDR_if_tag_eq_p:cn { show-tags } { ##1 } ||
2368       \CDR_if_tag_eq_p:cn { show-tags } { same } &&
2369       \CDR_if_tag_eq_p:cn { numbers } { ##1 }
2370     ) && ! \CDR_if_already_tags_p:
2371   } {
2372     \prg_return_true:
2373   } {
2374     \prg_return_false:
2375   }
2376 }

```

`\CDRBlock_tags_setup:N`
`\CDRBlock_engine_setup:N`

Utility to setup the tags, the tag inheritance tree and the engine. When not provided explicitly with the `tags=...` user interface, a code chunk will have the list of tags stored in `\g_CDR_tags_clist` by last `\CDRExport`, `\CDRSet` or `\CDRBlock` environment. At least one tag must be provided, either implicitly or explicitly.

```

2377 \cs_new_protected_nopar:Npn \CDRBlock_tags_setup:N #1 {
2378 \CDR@Debug{ \string \CDRBlock_tags_setup:N, \string #1 }
2379   \CDR_local_inherit:n { __tags }
2380   \CDR_local_set_known:N #1
2381   \CDR_if_tag_exist_here:ccT { __local } { tags } {
2382     \CDR_tag_get:cN { tags } \l_CDR_clist
2383     \clist_if_empty:NF \l_CDR_clist {
2384       \clist_gset_eq:NN \g_CDR_tags_clist \l_CDR_clist
2385     }
2386   }
2387   \clist_if_empty:NT \g_CDR_tags_clist {
2388     \PackageWarning
2389       { coder }
2390       { No~(default)~tags~provided. }
2391   }
2392 \CDR@Debug {CDRBlock_tags_setup:N\space\g_CDR_tags_clist}

```

Setup the inheritance tree for the `\CDR_tag_get:...` related functions.

```

2393 \CDR_get_inherit:f {
2394   \g_CDR_tags_clist,
2395   __block, __tags, __engine, default.block, __pygments.block,
2396   __fancyvrb.block __fancyvrb.frame, __fancyvrb.number,
2397   __pygments, default, __fancyvrb,
2398 }

```

For each `<tag name>`, create an `l3int` variable and initialize it to 1.

```

2399 \clist_map_inline:Nn \g_CDR_tags_clist {
2400   \CDR_int_if_exist:cF { ##1 } {
2401     \CDR_int_new:cn { ##1 } { 1 }
2402   }
2403 }
2404 }

```

Now setup the engine options if any.

```

2405 \cs_new_protected_nopar:Npn \CDRBlock_engine_setup:N #1 {
2406 \CDR@Debug{ \string \CDRBlock_engine_setup:N, \string #1 }
2407 \CDR_local_inherit:n { __engine }
2408 \CDR_local_set_known:N #1
2409 \CDR_tag_get:cNT { engine } \l_CDR_tl {
2410 \clist_put_left:Nx #1 { \CDRBlock_options_use:V \l_CDR_tl }
2411 }
2412 }

```

16 Management

`\g_CDR_in_impl_bool` Whether we are currently in the implementation section.

```

2413 \bool_new:N \g_CDR_in_impl_bool

```

(End definition for `\g_CDR_in_impl_bool`. This variable is documented on page ??.)

<code>\CDR_if_show_code_p: *</code>	<code>\CDR_if_show_code:TF {⟨true code⟩} {⟨false code⟩}</code>
<code>\CDR_if_show_code:TF *</code>	Execute <code>⟨true code⟩</code> when code should be printed, <code>⟨false code⟩</code> otherwise.

```

2414 \prg_new_conditional:Nnn \CDR_if_show_code: { p, T, F, TF } {
