

# `coder` — code inlined in a $\text{\LaTeX}$ document<sup>\*</sup>

Jérôme LAURENS<sup>†</sup>

Released 2022/02/07

## Abstract

Usually, documentation is put inside the code, `coder` allows to work the other way round by putting code inside the documentation. This is particularly interesting when different code files share some logic and should be documented all at once. The file `coder-manual.pdf` gives different examples. Here is the implementation of the package.

This  $\text{\LaTeX}$  package requires `LuaTeX` and may use syntax coloring based on `pygments`.

## 1 Package dependencies

`luacode`, `datetime2`, `xcolor`, `fancyvrb` and dependencies of these packages.

## 2 Similar technologies

The `docstrip` utility offers similar features, it is somehow more powerful than `coder` at the cost of more technicality and less practicality,

The `ydoc.cls` and `skdoc.cls` are full document classes with similar features but many more that are unrelated. `coder` focuses on code inlining and interfaces very well with `pygments` for a smart and efficient syntax highlighting.

The `pygmentex` and `minted` packages were somehow a source of inspiration.

## 3 Known bugs and limitations

- `coder` does not play well with `docstrip`.

---

<sup>\*</sup>This file describes version 2022/02/07, last revised 2022/02/07.

<sup>†</sup>E-mail: [jerome.laurens@u-bourgogne.fr](mailto:jerome.laurens@u-bourgogne.fr)

## 4 Namespace and conventions

L<sup>A</sup>T<sub>E</sub>X identifiers related to `coder` start with `CDR`, including both commands and environments. `expl3` identifiers also start with `CDR`, after and eventual leading `c_`, `l_` or `g_`. `l3keys` module path's first component is either `CDR` or starts with `CDR@`.

lua objects (functions and variables) are collected in the `CDR` table automatically created while loading `coder-util.lua` from `coder.sty`.

The `c` argument specifier is used here in a more general acception. Normally , it means that the argument is turned to a command sequence name. Here, it means that the argument is part of something bigger which is turned to a command sequence name. As such, there is no need to explicitly expand such an argument.

## 5 Presentation

`coder` is a triptych of three complementary components

1. `coder.sty`, on the L<sup>A</sup>T<sub>E</sub>X side,
2. `coder-util.lua`, to store data and call `coder-tool.py`,
3. `coder-tool.py`, to color code with the help of `pygments`.

`coder.sty` mainly declares the `\CDRCode` command and the `CDRBlock` environment. The former allows to insert code chunks as running text whereas the latter allows to insert code snippets as blocks. Moreover, block code chunks can be exported to files, once declared with `\CDRExport` command. The `\CDRSet` command is used to set various parameters, including display engines declared with either `\CDRCodeEngineNew` or `\CDRBlockEngineNew`.

### 5.1 Code flow

The normal code flow is

1. from `coder.sty`, L<sup>A</sup>T<sub>E</sub>X parses a code snippet as `\CDRCode` argument of `CDRBlock` environment body, somehow stores it, and calls either `CDR:highlight_source`,
2. `coder-util.lua` reads the content of some command, and stores it in a `json` file, together with informations to process this code snippet properly,
3. `coder-tool.py` is asked by `coder-util.lua` to read the `json` file and eventually uses `pygments` to translate the code snippet into dedicated L<sup>A</sup>T<sub>E</sub>X coloring commands. These are stored in a `*.pyg.tex` file named after the md5 digest of the original code chunk, a `*.pyg.sty` L<sup>A</sup>T<sub>E</sub>X style file is recorded as well. On return, `coder-tool.py` gives to `coder-util.lua` some L<sup>A</sup>T<sub>E</sub>X instructions to both input the `*.pyg.sty` and the `*.pyg.tex` file, these are finally executed and the code is displayed with colors. `coder-tool.py` is also partially responsible of code line numbering.

The package `coder.sty` only exchanges with `coder-util.lua` using `\directlua` and `tex.print`. `coder-tool.py` in turn only exchanges with `coder-util.lua`: we put in `coder-tool.py` as few L<sup>A</sup>T<sub>E</sub>X logic as possible. It receives instructions from `coder.sty` as command line arguments, L<sup>A</sup>T<sub>E</sub>X options, `pygments` options and `fancyvrb` options.

## 5.2 File exports

1. The `\CDRExport` command declares a file path, a list of tags and other useful information like a coding language. These data are saved as export records by `coder-util.lua`.
2. When some `tags={...}` have been given to the `CDRBlock` environment, the `coder-util.lua` records the corresponding code chunk and its associate tags for later save.
3. Once the typesetting process is complete, `coder-util.lua`'s `CDR_export_...` methods are called to save all the files externally. For each export record, `coder-util.lua` collects all the chunks with the same tag and save them at the proper location.

## 5.3 Display engine

The display management is partly delegated to other packages. `coder.sty` provides default engines for running code and code blocks, and new engines can be declared with `\CDRCodeEngineNew` and `\CDRBlockEngineNew`.

## 5.4 L<sup>A</sup>T<sub>E</sub>X user interface

The first required argument of both commands and environment is a `<key[=value] controls>` list managed by `l3keys`. Each command requires its own `l3keys` module but some `<key[=value] controls>` are shared between modules.

## 5.5 Properties and inheritance

Properties cover various informations, from the language of the code, to the color and font. They are uniquely identified by a path component, the *tag*, which is used for inheritance. All tags starting with two leading underscore characters are reserved by the package. Other tags are at the user disposal.

Each processed code chunk has a list of associate tags. Most tag inherits from default ones.

# 6 Options

Key-value options allow the user, `coder.sty`, `coder-util.lua` and `CDRPy` to exchange data. What the user is allowed to do is detailed in [coder-manual.pdf](#).

## 6.1 fancyvrb

These are `fancyvrb` options verbatim. The `fancyvrb` manual has more details, only some parts are reproduced hereafter. All of these options may not be relevant for all situations. Some of them make no sense in `code` mode, whereas others may not be compatible with the display engine.

- **formatcom**=`<command>` execute before printing verbatim text. Initially empty. Ignored in `code` mode.
- **fontfamily**=`<family name>` font family to use. `tt`, `courier` and `helvetica` are pre-defined. Initially `tt`.

- **fontsize**= $\langle$ *font size* $\rangle$  size of the font to use. If you use the **relsize** package as well, you can require a change of the size proportional to the current one (for instance: **fontsize**=**\relsize**{-2}). Initially **auto**: the same as the current font.
- **fontshape**= $\langle$ *font shape* $\rangle$  font shape to use. Initially **auto**: the same as the current font.
- **showspaces**[=**true**|**false**] print a special character representing each space. Initially **false**: spaces not shown.
- **showtabs**=**true**|**false** explicitly show tab characters. Initially **false**: tab characters not shown.
- **obeytabs**=**true**|**false** position characters according to the tabs. Initially **false**: tab characters are added to the current position.
- **tabsize**= $\langle$ *integer* $\rangle$  number of spaces given by a tab character, Initially 2 (8 for **fancyvrb**).
- **defineactive**= $\langle$ *macro* $\rangle$  to define the effect of active characters. This allows to do some devious tricks, see the **fancyvrb** package. Initially empty.
- ✓ **relabel**= $\langle$ *label* $\rangle$  define a label to be used with **\pageref**. Initially empty.
- **commentchar**= $\langle$ *character* $\rangle$  lines starting with this character are ignored. Initially empty.
- **gobble**= $\langle$ *integer* $\rangle$  number of characters to suppress at the beginning of each line (from 0 to 9), mainly useful when environments are indented. Only **block** mode.
- **frame**=**none**|**leftline**|**topline**|**bottomline**|**lines**|**single** type of frame around the verbatim environment. With **leftline** and **single** modes, a space of a length given by the L<sup>A</sup>T<sub>E</sub>X **\fboxsep** macro is added between the left vertical line and the text. Initially **none**: no frame.
- **label**={ [**top string**]  $\langle$ *string* $\rangle$  } label(s) to print on top, bottom or both, frame lines. If the label(s) contains special characters, comma or equal sign, it must be placed inside a group. If an optional  $\langle$ *top string* $\rangle$  is given between square brackets, it will be used for the top line and  $\langle$ *string* $\rangle$  for the bottom line. Otherwise,  $\langle$ *string* $\rangle$  is used for both the top or bottom lines. Label(s) are printed only if the **frame** parameter is one of **topline**, **bottomline**, **lines** or **single**. Initially empty: no label.
- **labelposition**=**none**|**topline**|**bottomline**|**all** position where to print the label(s) when defined. When options happen to be contradictory, like **frame**=**topline** and **labelposition**=**bottomline**, nothing is displayed. Initially **none** when no labels are defined, **topline** for one label and **all** otherwise.
- **numbers**=**none**|**left**|**right** numbering of the verbatim lines. If requested, this numbering is done outside the verbatim environment. Initially **none**: no numbering.
- **numbersep**= $\langle$ *dimension* $\rangle$  gap between numbers and verbatim lines. Initially 12pt.

- **firstnumber=auto|last| $\langle integer \rangle$**  number of the first line. **last** means that the numbering is continued from the previous verbatim environment. If an integer is given, its value will be used to start the numbering. Initially **auto**: numbering starts from 1.
- **stepnumber= $\langle integer \rangle$**  interval at which line numbers are printed. Initially 1: all lines are numbered.
- **numberblanklines[=true|false]** to number or not the white lines (really empty or containing blank characters only). Initially **true**: all lines are numbered.
- **firstline= $\langle integer \rangle$**  first line to print. Initially empty: all lines from the first are printed.
- **lastline= $\langle integer \rangle$**  last line to print. Initially empty: all lines until the last one are printed.
- **baselinestretch=auto| $\langle dimension \rangle$**  value to give to the usual `\baselinestretch` L<sup>A</sup>T<sub>E</sub>X parameter. Initially **auto**: its current value just before the verbatim command.
- ⊘ **commandchars= $\langle three\ characters \rangle$**  characters which define the character which starts a macro and marks the beginning and end of a group; thus lets us introduce escape sequences in verbatim code. Of course, it is better to choose special characters which are not used in the verbatim text. Private to **coder**, unavailable to users.
- **xleftmargin= $\langle dimension \rangle$**  indentation to add at the start of each line. Initially **0pt**: no left margin.
- **xrightmargin= $\langle dimension \rangle$**  right margin to add after each line. Initially **0pt**: no right margin.
- **resetmargins[=true|false]** reset the left margin, which is useful if we are inside other indented environments. Initially **true**.
- **hfuzz= $\langle dimension \rangle$**  value to give to the T<sub>E</sub>X `\hfuzz` dimension for text to format. This can be used to avoid seeing some unimportant overfull box messages. Initially **2pt**.
- **samepage[=true|false]** in very special circumstances, we may want to make sure that a verbatim environment is not broken, even if it does not fit on the current page. To avoid a page break, we can set the **samepage** parameter to **true**. Initially **false**.

## 6.2 pygments options

These are pygments's `LatexFormatter` options, used only by `coder-util.lua` to communicate with `coder-tool.py`.

- **style= $\langle name \rangle$**  the pygments style to use. Initially **default**.
- ⊘ **full** Tells the formatter to output a **full** document, i.e. a complete self-contained document (default: **false**). Forbidden.
- ⊘ **title** If **full** is true, the title that should be used to caption the document (default empty). Forbidden.

- ⊘ **encoding** If given, must be an encoding name. This will be used to convert the Unicode token strings to byte strings in the output. If it is `or None`, Unicode strings will be written to the output file, which most file-like objects do not support (default: `None`).
- ⊘ **outencoding** Overrides **encoding** if given.
- ⊘ **docclass** If the **full** option is enabled, this is the document class to use (default: `article`). Forbidden.
- ⊘ **preamble** If the **full** option is enabled, this can be further preamble commands, e.g. `"\usepackage"` (default `empty`). Forbidden.
- ⊘ **linenos**`[=true|false]` If set to `true`, output line numbers. Initially `false`: no numbering. Ignored in `code` mode.
- ⊘ **linenostart**`=<integer>` The line number for the first line. Initially 1: numbering starts from 1. Ignored in `code` mode.
- ⊘ **linenostep**`=<integer>` If set to a number  $n > 1$ , only every  $n$ th line number is printed. Ignored in `code` mode. Additional options given to the `Verbatim` environment (see the `fancyvrb` docs for possible values). Initially `empty`.
- ⊘ **verboptions** Forbidden.
- **commandprefix**`=<text>` The LaTeX commands used to produce colored output are constructed using this prefix and some letters. Initially `PY`.
- **texcomments**`[=true|false]` If set to `true`, enables LaTeX comment lines. That is, LaTeX markup in comment tokens is not escaped so that LaTeX can render it. Initially `false`. Ignored in `code` mode.
- **mathescape**`[=true|false]` If set to `true`, enables LaTeX math mode escape in comments. That is, `$...$` inside a comment will trigger math mode. Initially `false`.
- **escapeinside**`=<before><after>` If set to a string of length 2, enables escaping to LaTeX. Text delimited by these 2 characters is read as LaTeX code and typeset accordingly. It has no effect in string literals. It has no effect in comments if **texcomments** or **mathescape** is set. Initially `empty`.
- ⚙ **envname**`=<name>` Allows you to pick an alternative environment name replacing `Verbatim`. The alternate environment still has to support `Verbatim`'s option syntax. Initially `Verbatim`.

### 6.3 LaTeX

These are options used by `coder.sty` to pass data to `coder-tool.py`. All values are required, possibly empty.

- **tags** `clist` of tag names, used for line numbering.
- **inline** `true` when inline code is concerned, `false` otherwise.
- **sty\_template** LaTeX source text where `<placeholder:style_defs>` must be replaced by the style definitions provided by `pygments`. It may include the style name.

All the line templates below are L<sup>A</sup>T<sub>E</sub>X source text where `<placeholder:number>` should be replaced by a line number and `<placeholder:line>` should be replaced by the highlighted line code provided by `pygments`. They should not include a trailing newline char.

- **single\_line\_template** It may contain tag related information and number as well. When the block consists of only one line.
- **first\_line\_template** When the block consists of more than one line. If the tag information is required or new, display only the tag. Display the number if required, otherwise.
- **second\_line\_template** If the first line did not, display the line number, but only when required.
- **black\_line\_template** for numbered lines,
- **white\_line\_template** for unnumbered lines,

## File I

# coder-util.lua implementation

## 1 Usage

This lua library is loaded by `coder.sty` with the instruction `CDR=require(coder-util)`. In the sequel, the syntax to call class methods and instance methods are presented with either a `CDR.` or a `CDR:` prefix. This is what is used in the library for convenience. Of course either a `self.` or a `self:` prefix would be possible.

## 2 Declarations

```

1 %<*lua>
2 local lfs    = _ENV.lfs
3 local tex    = _ENV.tex
4 local token  = _ENV.token
5 local md5    = _ENV.md5
6 local kpse   = _ENV.kpse
7 local rep    = string.rep
8 local lpeg   = require("lpeg")
9 local P, Cg, Cp, V = lpeg.P, lpeg.Cg, lpeg.Cp, lpeg.V
10 local json  = require('lualibs-util-jsn')
```

## 3 General purpose material

**CDR\_PY\_PATH** Location of the `coder-tool.py` utility. This will cause an error if `kpse` which is not available. The PATH must be properly set up.

```
11 local CDR_PY_PATH = kpse.find_file('coder-tool.py')
```

*(End definition for CDR\_PY\_PATH. This variable is documented on page ??.)*

**PYTHON\_PATH** Location of the `python` utility, defaults to `'python'`.

```
12 local PYTHON_PATH = io.popen([[which python]]):read('a'):match("^%s*(.-%s*$")
```

*(End definition for PYTHON\_PATH. This variable is documented on page ??.)*

---

**set\_python\_path** CDR:set\_python\_path(*<path var>*)

 Set manually the path of the `python` utility with the contents of the *<path var>*. If the given path does not point to a file or a link then an error is raised.

```
13 local function set_python_path(self, path_var)
14   local path = assert(token.get_macro(assert(path_var)))
15   if #path>0 then
16     local mode,_,_ = lfs.attributes(self.PYTHON_PATH,'mode')
17     assert(mode == 'file' or mode == 'link')
18   else
19     path = io.popen([[which python]]):read('a'):match("^%s*(.-%s*$")
20   end
21   self.PYTHON_PATH = path
22 end
```

---

**is\_truthy** if CDR.is\_truthy(*<string>*) then  
*<true code>*  
else  
*<false code>*  
end

Execute *<false code>* if *<string>* is the string `"false"`, *<true code>* otherwise.

```
23 local function is_truthy(s)
24   return s ~= 'false'
25 end
```

---

**escape** *<variable>* = CDR.escape(*<string>*)

 Escape the given string to be used by the shell.

```
26 local function escape(s)
27   s = s:gsub(' ','\\ ')
28   s = s:gsub('\\','\\\\')
29   s = s:gsub('\\r','\\r')
30   s = s:gsub('\\n','\\n')
31   s = s:gsub('"','\\"')
32   s = s:gsub("'",'"')
33   return s
34 end
```

---

**make\_directory** *<variable>* = CDR.make\_directory(*<string path>*)

Make a directory at the given path.

```

35 local function make_directory(path)
36   local mode,_,__ = lfs.attributes(path,"mode")
37   if mode == "directory" then
38     return true
39   elseif mode ~= nil then
40     return nil,path.." exist and is not a directory",1
41   end
42   if os["type"] == "windows" then
43     path = path:gsub("/", "\\")
44     _,_,__ = os.execute(
45       "if not exist " .. path .. "\\nul " .. "mkdir " .. path
46     )
47   else
48     _,_,__ = os.execute("mkdir -p " .. path)
49   end
50   mode = lfs.attributes(path,"mode")
51   if mode == "directory" then
52     return true
53   end
54   return nil,path.." exist and is not a directory",1
55 end

```

**dir\_p** The directory where the auxiliary pygments related files are saved, in general  $\langle jobname \rangle$ .pygd/.

*(End definition for dir\_p. This variable is documented on page ??.)*

**json\_p** The path of the JSON file used to communicate with coder-tool.py, in general  $\langle jobname \rangle$ .pygd/ $\langle jobname \rangle$

*(End definition for json\_p. This variable is documented on page ??.)*

```

56 local dir_p, json_p
57 local jobname = tex.jobname
58 dir_p = './..jobname..'pygd/'
59 if make_directory(dir_p) == nil then
60   dir_p = './'
61   json_p = dir_p..jobname..'pyg.json'
62 else
63   json_p = dir_p..'input.pyg.json'
64 end

```

---

**print\_file\_content** CDR.print\_file\_content( $\langle macro name \rangle$ )

The command named  $\langle macro name \rangle$  contains the path to a file. Read the content of that file and print the result to the T<sub>E</sub>X stream.

```

65 local function print_file_content(name)
66   local p = token.get_macro(name)
67   local fh = assert(io.open(p, 'r'))
68   local s = fh:read('a')
69   fh:close()
70   tex.print(s)
71 end

```

---

**safe\_equals**     $\langle \text{variable} \rangle = \text{safe\_equals}(\langle \text{string} \rangle)$

---

Class method. Returns an  $\langle =...= \rangle$  string as  $\langle \text{ans} \rangle$  exactly composed of sufficiently many = signs such that  $\langle \text{string} \rangle$  contains neither sequence  $[\langle \text{ans} \rangle [ \text{ nor } ] \langle \text{ans} \rangle]$ .

```
72 local eq_pattern = P({ Cp() * P('=')^1 * Cp() + P(1) * V(1) })
73 local function safe_equals(s)
74   local i, j = 0, 0
75   local max = 0
76   while true do
77     i, j = eq_pattern:match(s, j)
78     if i == nil then
79       return rep('=', max + 1)
80     end
81     i = j - i
82     if i > max then
83       max = i
84     end
85   end
86 end
```

---

**load\_exec**     $\text{CDR:load\_exec}(\langle \text{lua code chunk} \rangle)$

---

Class method. Loads the given  $\langle \text{lua code chunk} \rangle$  and execute it. On error, messages are printed.

```
87 local function load_exec(self, chunk)
88   local env = setmetatable({ self = self, tex = tex }, _ENV)
89   local func, err = load(chunk, 'coder-tool', 't', env)
90   if func then
91     local ok
92     ok, err = pcall(func)
93     if not ok then
94       print("coder-util.lua Execution error:", err)
95       print('chunk:', chunk)
96     end
97   else
98     print("coder-util.lua Compilation error:", err)
99     print('chunk:', chunk)
100   end
101 end
```

---

`load_exec_output`

---

`CDR:load_exec_output( $\langle$ lua code chunk $\rangle$ )`

Instance method to parse the  $\langle$ lua code chunk $\rangle$  string for commands and execute them. The patterns being searched are enclosed within opening `<<<<<` and closing `>>>>>`, each containing 5 characters,

**?TEX:** $\langle$ TeX instructions $\rangle$  the  $\langle$ TeX instructions $\rangle$  are executed asynchronously once the control comes back to T<sub>E</sub>X.

**!LUA:** $\langle$ !Lua instructions $\rangle$  the  $\langle$ !Lua instructions $\rangle$  are executed synchronously. When not properly designed, these instructions may cause a forever loop on execution, for example, they must not use `CDR:if_code_engine`.

**?LUA:** $\langle$ ?Lua instructions $\rangle$  these  $\langle$ ?Lua instructions $\rangle$  are executed asynchronously once the control comes back to T<sub>E</sub>X through a call to `\directlua`, which means that they will wait until any previous asynchronous  $\langle$ ?TeX instructions $\rangle$  or  $\langle$ ?Lua instructions $\rangle$  completes.

```
102 local parse_pattern
103 do
104   local tag = P('!'') + '*' + '?'
105   local stp = '>>>>>'
106   local cmd = (P(1) - stp)^0
107   parse_pattern = P({
108     P('<<<<<') * Cg(tag) * 'LUA:' * Cg(cmd) * stp * Cp() + 1 * V(1)
109   })
110 end
111 local function load_exec_output(self, s)
112   local i, tag, cmd
113   i = 1
114   while true do
115     tag, cmd, i = parse_pattern:match(s, i)
116     if tag == '!' then
117       self:load_exec(cmd)
118     elseif tag == '*' then
119       local eqs = safe_equals(cmd)
120       cmd = '[' .. eqs .. '[' .. cmd .. ']' .. eqs .. ']'
121       tex.print([[
122 \directlua{CDR:load_exec[]]..cmd..[]}]%
123 ]])
124     elseif tag == '?' then
125       print('\nDEBUG/coder: ' .. cmd)
126     else
127       return
128     end
129   end
130 end
```

## 4 Properties

This is one of the channels from `coder.sty` to `coder-util.lua`.

## 5 Hiligting

### 5.1 Common

---

**highlight\_set** CDR:highlight\_set(...)

---

Highlight the currently entered block. Build a configuration table with all data necessary for the processing, save it as a JSON file and launch `coder-tool.py` with the proper arguments.

```
131 local function highlight_set(self, key, value)
132   local args = self['.arguments']
133   local t = args
134   if t[key] == nil then
135     t = args.pygopts
136     if t[key] == nil then
137       t = args.texopts
138       assert(t[key] ~= nil)
139     end
140   end
141   t[key] = value
142 end
143
144 local function highlight_set_var(self, key, var)
145   self:highlight_set(key, assert(token.get_macro(var or 'l_CDR_tl'))))
146 end
```

---

**highlight\_source** CDR:highlight\_source(<src>, <sty>)

---

Highlight the currently entered block if <src> is true, build the style definitions if <sty> is true. Build a configuration table with all data necessary for the processing, save it as a JSON file and launch `coder-tool.py` with the proper arguments.

```
147 local function highlight_source(self, sty, src)
148   tex.write('THIS IS A TEST')
149   local args = self['.arguments']
150   local texopts = args.texopts
151   local pygopts = args.pygopts
152   local inline = texopts.is_inline
153   local use_cache = self.is_truthy(args.cache)
154   local use_py = false
155   local cmd = self.PYTHON_PATH..' '..self.CDR_PY_PATH
156   local debug = args.debug
157   local pyg_sty_p
158   if sty then
159     pyg_sty_p = dir_p..pygopts.style..'pyg.sty'
160     texopts.pyg_sty_p = pyg_sty_p
161     local mode,_,_ = lfs.attributes(pyg_sty_p, 'mode')
162     if not mode or not use_cache then
163       use_py = true

## 5.2 Code

---

highlight\_code\_prepare CDR:highlight\_code\_prepare()

Highlight the code in `str` variable named `<code var name>`. Build a configuration table with all data necessary for the processing, save it as a JSON file and launch `coder-tool.py` with the proper arguments.

```

260 local function highlight_code_prepare(self)
261     self['.arguments'] = {
262         __cls__ = 'Arguments',
263         source = '',
264         cache = true,
265         debug = false,

```

```

266     pygopts = {
267         __cls__ = 'PygOpts',
268         lang   = 'tex',
269         style  = 'default',
270     },
271     texopts = {
272         __cls__ = 'TeXOpts',
273         tags    = '',
274         is_inline = true,
275         pyg_sty_p = '',
276     }
277 }
278 self.hilight_json_written = false
279 end
280

```

### 5.3 Block

---

`hilight_block_prepare`    CDR:hilight\_block\_prepare( $\langle$ tags clist var $\rangle$ )

---

Records the contents of the  $\langle$ tags clist var $\rangle$  L<sup>A</sup>T<sub>E</sub>X variable to prepare block hilighting.

```

281 local function hilight_block_prepare(self, tags_clist_var)
282   local tags_clist = assert(token.get_macro(assert(tags_clist_var)))
283   local t = {}
284   for tag in string.gmatch(tags_clist, '([^\,]+)') do
285     t[#t+1]=tag
286   end
287   self['.tags clist'] = tags_clist
288   self['.block tags'] = t
289   self['.lines'] = {}
290   self['.arguments'] = {
291     __cls__ = 'Arguments',
292     cache   = false,
293     debug   = false,
294     source  = nil,
295     pygopts = {
296       __cls__ = 'PygOpts',
297       lang   = 'tex',
298       style  = 'default',
299     },
300     texopts = {
301       __cls__ = 'TeXOpts',
302       tags    = tags_clist,

314   local lt = self['lines by tag'] or {}
315   self['lines by tag'] = lt
316   for _,tag in ipairs(self['.block tags']) do
317     ll = lt[tag] or {}
318     lt[tag] = ll
319     ll[#ll+1] = line
320   end
321 end

```

---

**highlight\_advance** CDR:highlight\_advance(*<count>*)  
*<count>* is the number of line highlighted.

```

322 local function highlight_advance(self, count)
323 end

```

## 6 Exportation

For each file to be exported, coder.sty calls `export_file` to initialte the exportation. Then it calls `export_file_info` to share the tags, raw, preamble, postamble data. Finally, `export_complete` is called to complete the exportation.

---

**export\_file** CDR:export\_file(*<file name var>*)  
 This is called at export time. *<file name var>* is the name of an str variable containing the file name.

```

324 local function export_file(self, file_name)
325   self['.name'] = assert(token.get_macro(assert(file_name)))
326   self['.export'] = {}
327 end

```

---

**export\_file\_info** CDR:export\_file\_info(*<key>*, *<value name var>*)  
 This is called at export time. *<value name var>* is the name of an str variable containing the value.

```

328 local function export_file_info(self, key, value)
329   local export = self['.export']
330   value = assert(token.get_macro(assert(value)))
331   export[key] = value
332 end

```

---

**export\_complete** CDR:export\_complete()  
 This is called at export time.

```

333 local function export_complete(self)
334   local name    = self['.name']
335   local export  = self['.export']
336   local records = self['.records']
337   local tt = {}
338   local s = export.preamble
339   if s then
340     tt[#tt+1] = s
341   end
342   for _,tag in ipairs(export.tags) do
343     s = records[tag]:concat('\n')
344     tt[#tt+1] = s
345     records[tag] = { [1] = s }
346   end
347   s = export.postamble
348   if s then
349     tt[#tt+1] = s
350   end
351   if #tt>0 then
352     local fh = assert(io.open(name,'w'))
353     fh:write(tt:concat('\n'))
354     fh:close()
355   end
356   self['.file'] = nil
357   self['.exportation'] = nil
358 end

```

## 7 Caching

We save some computation time by pygmentizing files only when necessary. The `coder-tool.py` is expected to create a `*.pyg.sty` file for a style and a `*.pyg.tex` file for highlighted code. These files are cached during one whole L<sup>A</sup>T<sub>E</sub>X run and possibly between different L<sup>A</sup>T<sub>E</sub>X runs. Lua keeps track of both the style files created and highlighted code files created.

<code>cache_clean_all</code>	<code>CDR:cache_clean_all()</code>
<code>cache_record</code>	<code>CDR:cache_record(<i>&lt;style name.pyg.sty&gt;</i>, <i>&lt;digest.pyg.tex&gt;</i>)</code>
<code>cache_clean_unused</code>	<code>CDR:cache_clean_unused()</code>

Instance methods. `cache_clean_all` removes any file in the cache directory named `<jobname>.pygd`. This is automatically executed at the beginning of the document processing when there is no aux file. This can also be executed on demand with `\directlua{CDR:cache_clean_all()}`. The `cache_record` method stores both `<style name.pyg.sty>` and `<digest.pyg.tex>`. These are file names relative to the `<jobname>.pygd` directory. `cache_clean_unused` removes any file in the cache directory `<jobname>.pygd` except the ones that were previously recorded. This is executed at the end of the document processing.

```

359 local function cache_clean_all(self)
360   local to_remove = {}
361   for f in lfs.dir(dir_p) do
362     to_remove[f] = true
363   end
364   for k,_ in pairs(to_remove) do

```

```

365     os.remove(dir_p .. k)
366 end
367 end
368 local function cache_record(self, pyg_sty_p, pyg_tex_p)
369     if pyg_sty_p then
370         self['.style_set'] [pyg_sty_p] = true
371     end
372     if pyg_tex_p then
373         self['.colored_set'] [pyg_tex_p] = true
374     end
375 end
376 local function cache_clean_unused(self)
377     local to_remove = {}
378     for f in lfs.dir(dir_p) do
379         f = dir_p .. f
380         if not self['.style_set'] [f] and not self['.colored_set'] [f] then
381             to_remove[f] = true
382         end
383     end
384     for f, _ in pairs(to_remove) do
385         os.remove(f)
386     end
387 end

```

`_DESCRIPTION` Short text description of the module.

419 %</lua>
```

## File II

# `coder-tool.py` implementation

The standard header is managed specially because of the way `docstrip` automatically adds some header when extracting stuff from an archive. The next two lines are added by `docstrip` at the top of the preamble.

```
1 %<*py>
2 #! /usr/bin/env python3
3 # -*- coding: utf-8 -*-
4 %</py>
```

## 1 Usage

Run: `coder-tool.py -h`.

## 2 Header and global declarations

```
5 %<*py>
6 __version__ = '0.10'
7 __YEAR__   = '2022'
8 __docformat__ = 'restructuredtext'
9
10 import sys
11 import os
12 import argparse
13 import re
14 from pathlib import Path
15 import json
16 from pygments import highlight as hilight
17 from pygments.formatters.latex import LatexEmbeddedLexer, LatexFormatter
18 from pygments.lexers import get_lexer_by_name
19 from pygments.util import ClassNotFound
```

### 3 Options classes

Object is used to turn a dictionary into a full fledged object. The real class is given by the `__cls__` key.

```
20 class BaseOpts(object):
21     @staticmethod
22     def ensure_bool(x):
23         if x == True or x == False: return x
24         x = x[0:1]
25         return x == 'T' or x == 't'
26
27     def __init__(self, d={}):
28         for k, v in d.items():
29             if type(v) == str:
30                 if v.lower() == 'true':
31                     setattr(self, k, True)
32                 elif v.lower() == 'false':
33                     setattr(self, k, False)
34                 continue
35             setattr(self, k, v)
```

#### 3.1 TeXOpts class

```
36 class TeXOpts(BaseOpts):
37     tags      = ''
38     is_inline  = True
39     pyg_sty_p = None
```

The templates are provided by `coder.sty`. The style template wraps the style definitions provided by `pygments`. It may include the style name

```
40     sty_template=r'''% !TeX root=...
41 \makeatletter
42 \CDR@StyleDefine{<placeholder:style_name>} {%
43   <placeholder:style_defs>}%
44 \makeatother'''
45     single_line_template = r'''\CDR@Line{Single}{<placeholder:number>}{<placeholder:line>}'
46     first_line_template  = r'''\CDR@Line{First}{<placeholder:number>}{<placeholder:line>}'
47     second_line_template = r'''\CDR@Line{Second}{<placeholder:number>}{<placeholder:line>}'
48     white_line_template  = r'''\CDR@Line{White}{<placeholder:number>}{<placeholder:line>}'
49     black_line_template  = r'''\CDR@Line{Black}{<placeholder:number>}{<placeholder:line>}'
50     def __init__(self, *args, **kwargs):
51         super().__init__(*args, **kwargs)
52         self.inline_p = self.ensure_bool(self.is_inline)
53         self.pyg_sty_p = Path(self.pyg_sty_p or '')
```

#### 3.2 PygOptsclass

`pygments` LaTeXFormatter options. Some of them may be deliberately unused. In particular, line numbering is governed by `fancyvrb` options. The description of these options is in a forthcoming section.

```

54 class PygOpts(BaseOpts):
55     style = 'default'
56     nobackground = False
57     linenos = False
58     linenostart = 1
59     linenostep = 1
60     commandprefix = 'Py'
61     texcomments = False
62     mathescape = False
63     escapeinside = ""
64     envname = 'Verbatim'
65     lang = 'tex'
66     def __init__(self, *args, **kwargs):
67         super().__init__(*args, **kwargs)
68         self.linenos = self.ensure_bool(self.linenos)
69         self.linenostart = abs(int(self.linenostart))
70         self.linenostep = abs(int(self.linenostep))
71         self.texcomments = self.ensure_bool(self.texcomments)
72         self.mathescape = self.ensure_bool(self.mathescape)

```

### 3.3 FVclass

```

73 class FVOpts(BaseOpts):
74     gobble = 0
75     tabsize = 4
76     linenosep = 'Opt'
77     commentchar = ''
78     frame = 'none'
79     label = ''
80     labelposition = 'none'
81     numbers = 'left'
82     numbersep = '1ex'
83     firstnumber = 'auto'
84     stepnumber = 1
85     numberblanklines = True
86     firstline = ''
87     lastline = ''
88     baselinestretch = 'auto'
89     resetmargins = True
90     xleftmargin = 'Opt'
91     xrightmargin = 'Opt'
92     hfuzz = '2pt'
93     samepage = False
94     def __init__(self, *args, **kwargs):
95         super().__init__(*args, **kwargs)
96         self.gobble = abs(int(self.gobble))
97         self.tabsize = abs(int(self.tabsize))
98         if self.firstnumber != 'auto':
99             self.firstnumber = abs(int(self.firstnumber))
100         self.stepnumber = abs(int(self.stepnumber))
101         self.numberblanklines = self.ensure_bool(self.numberblanklines)
102         self.resetmargins = self.ensure_bool(self.resetmargins)
103         self.samepage = self.ensure_bool(self.samepage)

```

### 3.4 Argumentsclass

```
104 class Arguments(BaseOpts):
105     cache = False
106     debug = False
107     source = ""
108     style = "default"
109     json = ""
110     directory = "."
111     texopts = TeXOpts()
112     pygopts = PygOpts()
113     fv_opts = FVOpts()
```

## 4 Controller main class

```
114 class Controller:
```

### 4.1 Static methods

---

<b>object_hook</b>	Helper for json parsing.
--------------------	--------------------------

---

```
115     @staticmethod
116     def object_hook(d):

```

---

`lua_text_escape` `self.lua_text_escape(<text>)`

---

Wraps the given command between [=...=[ and ]=...=] with as many equal signs as necessary to ensure a correct lua syntax.

```
135 @staticmethod
136 def lua_text_escape(s):
137     k = 0
138     for m in re.findall('+=', s):
139         if len(m) > k: k = len(m)
140     k = (k + 1) * "="
141     return f'[{k}][{s}]{k}']
```

## 4.2 Computed properties

`self.json_p` The full path to the json file containing all the data used for the processing.

*(End definition for self.json\_p. This variable is documented on page ??.)*

```
142 _json_p = None
143 @property
144 def json_p(self):
145     p = self._json_p
146     if p:
147         return p
148     else:
149         p = self.arguments.json
150         if p:
151             p = Path(p).resolve()
152         self._json_p = p
153     return p
```

`self.parser` The correctly set up `argparse` instance.

*(End definition for self.parser. This variable is documented on page ??.)*

```
154 @property
155 def parser(self):
156     parser = argparse.ArgumentParser(
157         prog=sys.argv[0],
158         description='',
159         Writes to the output file a set of LaTeX macros describing
160         the syntax highlighting of the input file as given by pygments.
161         ''',
162     )
163     parser.add_argument(
164         "-v", "--version",

167         version=f'coder-tool version {__version__}',
168         ' (c) {__YEAR__} by Jérôme LAURENS.'
169     )
170     parser.add_argument(
171         "--debug",
172         action='store_true',
```

```

173     default=None,
174     help="display informations useful for debugging"
175 )
176 parser.add_argument(
177     "--create_style",
178     action='store_true',
179     default=None,
180     help="create the style definitions"
181 )
182 parser.add_argument(
183     "--base",
184     action='store',
185     default=None,
186     help="the path of the file to be colored, with no extension"
187 )
188 parser.add_argument(
189     "json",
190     metavar="<json data file>",
191     help=""
192     file name with extension, contains processing information.
193 )
194 )
195 return parser
196

```

## 4.3 Methods

### 4.3.1 \_\_init\_\_

---

\_\_init\_\_ Constructor. Reads the command line arguments.

```

197 def __init__(self, argv = sys.argv):
198     argv = argv[1:] if re.match(".*coder\-.tool\.py$", argv[0]) else argv
199     ns = self.parser.parse_args(
200         argv if len(argv) else ['-h']
201     )
202     with open(ns.json, 'r') as f:
203         self.arguments = json.load(
204             f,
205             object_hook = Controller.object_hook
206         )
207     args = self.arguments
208     args.json = ns.json

### 3 Constants

`\c_CDR_tag` Paths of L3keys modules.  
`\c_CDR_Tags` These are root path components used throughout the package.

```
21 \str_const:Nn \c_CDR_Tags { CDR@Tags }
22 \str_const:Nx \c_CDR_tag { \c_CDR_Tags/tag }
```

*(End definition for \c\_CDR\_tag and \c\_CDR\_Tags. These variables are documented on page ??.)*

`\c_CDR_tag_get` Root identifier for tag properties, used throughout the package.  
`\c_CDR_slash`

```
23 \str_const:Nn \c_CDR_tag_get { CDR@tag@get }
24 \str_const:Nx \c_CDR_slash { \tl_to_str:n {/} }
```

*(End definition for \c\_CDR\_tag\_get and \c\_CDR\_slash. These variables are documented on page ??.)*

### 4 Implementation details

As far as possible, macro making assignments to variables are protected. All variables following expl3 naming conventions are implementation details and therefore must be considered private.

### 5 Variables

#### 5.1 Internal scratch variables

These local variables are used in a very limited scope.

`\l_CDR_bool` Local scratch variable.

```
25 \bool_new:N \l_CDR_bool
```

*(End definition for \l\_CDR\_bool. This variable is documented on page ??.)*

`\l_CDR_tl` Local scratch variable.

```
26 \tl_new:N \l_CDR_tl
```

*(End definition for \l\_CDR\_tl. This variable is documented on page ??.)*

`\l_CDR_str` Local scratch variable.

```
27 \str_new:N \l_CDR_str
```

*(End definition for \l\_CDR\_str. This variable is documented on page ??.)*

`\l_CDR_seq` Local scratch variable.

```
28 \seq_new:N \l_CDR_seq
```

*(End definition for \l\_CDR\_seq. This variable is documented on page ??.)*

`\l_CDR_prop` Local scratch variable.

```
29 \prop_new:N \l_CDR_prop
```

*(End definition for \l\_CDR\_prop. This variable is documented on page ??.)*

`\l_CDR_clist` The comma separated list of current chunks.

30 `\clist_new:N \l_CDR_clist`

*(End definition for \l\_CDR\_clist. This variable is documented on page ??.)*

## 5.2 Files

`\l_CDR_in` Input file identifier

31 `\ior_new:N \l_CDR_in`

*(End definition for \l\_CDR\_in. This variable is documented on page ??.)*

`\l_CDR_out` Output file identifier

32 `\iow_new:N \l_CDR_out`

*(End definition for \l\_CDR\_out. This variable is documented on page ??.)*

## 5.3 Global variables

Line number counter for the source code chunks.

`\g_CDR_source_int` Chunk number counter.

33 `\int_new:N \g_CDR_source_int`

*(End definition for \g\_CDR\_source\_int. This variable is documented on page ??.)*

`\g_CDR_source_prop` Global source property list.

34 `\prop_new:N \g_CDR_source_prop`

*(End definition for \g\_CDR\_source\_prop. This variable is documented on page ??.)*

`\g_CDR_chunks_tl` The comma separated list of current chunks. If the next list of chunks is the same as the  
`\l_CDR_chunks_tl` current one, then it might not display.

35 `\tl_new:N \g_CDR_chunks_tl`

36 `\tl_new:N \l_CDR_chunks_tl`

*(End definition for \g\_CDR\_chunks\_tl and \l\_CDR\_chunks\_tl. These variables are documented on page ??.)*

`\g_CDR_vars` Tree storage for global variables.

37 `\prop_new:N \g_CDR_vars`

*(End definition for \g\_CDR\_vars. This variable is documented on page ??.)*

`\g_CDR_hook_tl` Hook general purpose.

38 `\tl_new:N \g_CDR_hook_tl`

*(End definition for \g\_CDR\_hook\_tl. This variable is documented on page ??.)*

`\g/CDR/Chunks/<name>` List of chunk keys for given named code.

*(End definition for \g/CDR/Chunks/<name>. This variable is documented on page ??.)*

## 5.4 Local variables

`\l_CDR_keyval_tl` keyval storage.

```
39 \tl_new:N \l_CDR_keyval_tl
```

*(End definition for \l\_CDR\_keyval\_tl. This variable is documented on page ??.)*

`\l_CDR_options_tl` options storage.

```
40 \tl_new:N \l_CDR_options_tl
```

*(End definition for \l\_CDR\_options\_tl. This variable is documented on page ??.)*

`\l_CDR_recorded_tl` Full verbatim body of the CDR environment.

```
41 \tl_new:N \l_CDR_recorded_tl
```

*(End definition for \l\_CDR\_recorded\_tl. This variable is documented on page ??.)*

`\g_CDR_int` Global integer to store linenos locally in time.

```
42 \int_new:N \g_CDR_int
```

*(End definition for \g\_CDR\_int. This variable is documented on page ??.)*

`\l_CDR_line_tl` Token list for one line.

```
43 \tl_new:N \l_CDR_line_tl
```

*(End definition for \l\_CDR\_line\_tl. This variable is documented on page ??.)*

`\l_CDR_linenos_tl` Token list for linenos display.

```
44 \tl_new:N \l_CDR_linenos_tl
```

*(End definition for \l\_CDR\_linenos\_tl. This variable is documented on page ??.)*

`\l_CDR_name_tl` Token list for chunk name display.

```
45 \tl_new:N \l_CDR_name_tl
```

*(End definition for \l\_CDR\_name\_tl. This variable is documented on page ??.)*

`\l_CDR_info_tl` Token list for the info of line.

```
46 \tl_new:N \l_CDR_info_tl
```

*(End definition for \l\_CDR\_info\_tl. This variable is documented on page ??.)*

## 6 Tag properties

The tag properties concern the code chunks. They are set from different path, such that `\l_keys_path_str` must be properly parsed for that purpose. Commands in this section and the next ones contain `CDR_tag`.

The `<tag names>` starting with a double underscore are reserved by the package.

## 6.1 Helpers

`\g_CDR_tag_path_seq` Global variable to store relative key path. Used for automatic management to know what has been defined explicitly.

```
47 \seq_new:N \g_CDR_tag_path_seq
```

(End definition for `\g_CDR_tag_path_seq`. This variable is documented on page ??.)

---

<code>\CDR_tag_get_path:cc</code>	<code>★</code>	<code>\CDR_tag_get_path:cc {&lt;tag name&gt;} {&lt;relative key path&gt;}</code>
<code>\CDR_tag_get_path:c</code>	<code>★</code>	<code>\CDR_tag_get_path:c {&lt;relative key path&gt;}</code>

---

Internal: return a unique key based on the arguments. Used to store and retrieve values. In the second version, the `<tag name>` is not provided and set to `__local`.

```
48 \cs_new:Npn \CDR_tag_get_path:cc #1 #2 {
49   \c_CDR_tag_get @ #1 / #2
50 }
51 \cs_new:Npn \CDR_tag_get_path:c {
52   \CDR_tag_get_path:cc { __local }
53 }
```

## 6.2 Set

---

<code>\CDR_tag_set:ccn</code>	<code>\CDR_tag_set:ccn {&lt;tag name&gt;} {&lt;relative key path&gt;} {&lt;value&gt;}</code>
<code>\CDR_tag_set:ccV</code>	<code>\CDR_tag_set:ccV {&lt;tag name&gt;} {&lt;relative key path&gt;} {&lt;value&gt;}</code>

---

Store `<value>`, which is further retrieved with the instruction `\CDR_tag_get:cc {<tag name>} {<relative key path>}`. Only `<tag name>` and `<relative key path>` containing no `@` character are supported. Record the relative key path (the part after the tag name) of the current full key path in `g_CDR_tag_path_seq`. All the affectations are made at the current `TEX` group level. *Nota Bene*: `\cs_generate_variant:Nn` is buggy when there is a ‘c’ argument.

```
54 \cs_new_protected:Npn \CDR_tag_set:ccn #1 #2 #3 {
55   \seq_put_left:Nx \g_CDR_tag_path_seq { #2 }
56   \cs_set:cpn { \CDR_tag_get_path:cc { #1 } { #2 } } { \exp_not:n { #3 } }
57 }
58 \cs_new_protected:Npn \CDR_tag_set:ccV #1 #2 #3 {
59   \exp_args:NnnV
60   \CDR_tag_set:ccn { #1 } { #2 } #3
61 }
```

`\c_CDR_tag_regex` To parse a `l3keys` full key path.

```
62 \tl_set:Nn \l_CDR_tl { /([~/*])/(.*)$ } \use_none:n { $ }
63 \tl_put_left:Nv \l_CDR_tl \c_CDR_tag
64 \tl_put_left:Nn \l_CDR_tl { ^ }
65 \exp_args:NNV
66 \regex_const:Nn \c_CDR_tag_regex \l_CDR_tl
```

(End definition for `\c_CDR_tag_regex`. This variable is documented on page ??.)

---

`\CDR_tag_set:n`    `\CDR_tag_set:n {<value>}`

---

The value is provided but not the *<dir>* nor the *<relative key path>*, both are guessed from `\l_keys_path_str`. More precisely, `\l_keys_path_str` is expected to read something like `\c_CDR_tag/<tag name>/<relative key path>`, an exception is raised on the contrary. This is meant to be call from `\keys_define:nn` argument. Implementation detail: the last argument is parsed by the last command.

```
67 \cs_new:Npn \CDR_tag_set:n {
68   \exp_args:NnV
69   \regex_extract_once:NnNTF \c_CDR_tag_regex
70     \l_keys_path_str \l_CDR_seq {
71     \CDR_tag_set:ccn
72     { \seq_item:Nn \l_CDR_seq 2 }
73     { \seq_item:Nn \l_CDR_seq 3 }
74   } {
75     \PackageWarning
76       { coder }
77       { Unexpected~key~path~'\l_keys_path_str' }
78     \use_none:n
79   }
80 }
```

---

`\CDR_tag_set:`    `\CDR_tag_set:`

---

None of *<dir>*, *<relative key path>* and *<value>* are provided. The latter is guessed from `\l_keys_value_tl`, and `\CDR_tag_set:n` is called. This is meant to be call from `\keys_define:nn` argument.

```
81 \cs_new:Npn \CDR_tag_set: {
82   \exp_args:NV
83   \CDR_tag_set:n \l_keys_value_tl
84 }
```

---

`\CDR_tag_set:cn`    `\CDR_tag_set:cn {<key path>} {<value>}`

---

When the last component of `\l_keys_path_str` should not be used to store the *<value>*, but *<key path>* should be used instead. This last component is replaced and `\CDR_tag_set:n` is called afterwards. Implementation detail: the second argument is parsed by the last command of the expansion.

```
85 \cs_new:Npn \CDR_tag_set:cn #1 {
86   \exp_args:NnV
87   \regex_extract_once:NnNTF \c_CDR_tag_regex
88     \l_keys_path_str \l_CDR_seq {
89     \CDR_tag_set:ccn
90     { \seq_item:Nn \l_CDR_seq 2 }
91     { #1 }
92   } {
93     \PackageWarning
94       { coder }
95       { Unexpected~key~path~'\l_keys_path_str' }
96     \use_none:n
97   }
98 }
```

---

\CDR\_tag\_choices: \CDR\_tag\_choices:

Ensure that the \l\_keys\_path\_str is set properly. This is where a syntax like \keys\_set:nn {...} { choice/a } is managed.

```
99 \regex_const:Nn \c_CDR_root_regex { ^(.*)/.*$ } \use_none:n { $ }
100 \cs_new:Npn \CDR_tag_choices: {
101   \exp_args:NVV
102   \str_if_eq:nnT \l_keys_key_tl \l_keys_choice_tl {
103     \exp_args:NnV
104     \regex_extract_once:NnNT \c_CDR_root_regex
105       \l_keys_path_str \l_CDR_seq {
106       \str_set:Nx \l_keys_path_str {
107         \seq_item:Nn \l_CDR_seq 2
108       }
109     }
110   }
111 }
```

---

\CDR\_tag\_choices\_set: \CDR\_tag\_choices\_set:

Calls \CDR\_tag\_set:n with the content of \l\_keys\_choice\_tl as value. Before, ensure that the \l\_keys\_path\_str is set properly.

```
112 \cs_new:Npn \CDR_tag_choices_set: {
113   \CDR_tag_choices:
114   \exp_args:NV
115   \CDR_tag_set:n \l_keys_choice_tl
116 }
```

---

\CDR\_if\_tag\_truthy:ccTF \* \CDR\_if\_truthy:ccTF {<tag name>} {<relative key path>} {<true code>} {<false  
\CDR\_if\_tag\_truthy:ccTF \* code>}

\CDR\_if\_truthy:CTF {<relative key path>} {<true code>} {<false code>}

Execute <true code> when the property for <tag name> and <relative key path> is a truthy value, <false code> otherwise. A truthy value is a text which is not “false” in a case insensitive comparison. In the second version, the <tag name> is not provided and set to \_\_local.

```
117 \prg_new_conditional:Nnn \CDR_if_tag_truthy:cc { p, T, F, TF } {
118   \exp_args:Ne
119   \str_compare:nNnTF {
120     \exp_args:Ne \str_lowercase:n { \CDR_tag_get:cc { #1 } { #2 } }
121   } = { false } {
122     \prg_return_false:
123   } {
124     \prg_return_true:
125   }
126 }
127 \prg_new_conditional:Nnn \CDR_if_tag_truthy:c { p, T, F, TF } {
128   \exp_args:Ne
129   \str_compare:nNnTF {
130     \exp_args:Ne \str_lowercase:n { \CDR_tag_get:c { #1 } }
```

```

131 } = { false } {
132   \prg_return_false:
133 } {
134   \prg_return_true:
135 }
136 }

```

---

```

\CDR_if_truthy:nTF \CDR_if_truthy:nTF {<token list>} {<true code>} {<false code>}

```

---

```

\CDR_if_truthy:eTF

```

Execute *<true code>* when *<token list>* is a truthy value, *<false code>* otherwise. A truthy value is a text which leading character, if any, is none of “fFnN”.

```

137 \prg_new_conditional:Nnn \CDR_if_truthy:n { p, T, F, TF } {
138   \exp_args:Nf
139   \str_compare:nNnTF { \str_lowercase:n { #1 } } = { false } {
140     \prg_return_false:
141   } {
142     \prg_return_true:
143   }
144 }
145 \prg_generate_conditional_variant:Nnn \CDR_if_truthy:n { e } { p, T, F, TF }

```

---

```

\CDR_tag_boolean_set:n \CDR_tag_boolean_set:n {<choice>}

```

---

Calls `\CDR_tag_set:n` with true if the argument is truthy, false otherwise.

```

146 \cs_new_protected:Npn \CDR_tag_boolean_set:n #1 {
147   \CDR_if_truthy:nTF { #1 } {
148     \CDR_tag_set:n { true }
149   } {
150     \CDR_tag_set:n { false }
151   }
152 }
153 \cs_generate_variant:Nn \CDR_tag_boolean_set:n { x }

```

### 6.3 Retrieving tag properties

Internally, all tag properties are collected with a full key path like `\c_CDR_tag_get/<tag name>/<relative key path>`. When typesetting some code with either the `\CDRCode` command or the `CDRBlock` environment, all properties defined locally are collected under the reserved `\c_CDR_tag_get/__local/<relative path>` full key paths. The `l3keys` module `\c_CDR_tag_get/__local` is modified in  $\text{\TeX}$  groups only. For running text code chunks, this module inherits from

1. `\c_CDR_tag_get/<tag name>` for the provided *<tag name>*,
2. `\c_CDR_tag_get/default.code`
3. `\c_CDR_tag_get/default`
4. `\c_CDR_tag_get/__pygments`
5. `\c_CDR_tag_get/__fancyvrb`

6. \c\_CDR\_tag\_get/\_\_\_fancyvrb.all when no using pygments

For text block code chunks, this module inherits from

1. \c\_CDR\_tag\_get/⟨name<sub>1</sub>⟩, ..., \c\_CDR\_tag\_get/⟨name<sub>n</sub>⟩ for each tag name of the ordered tags list
2. \c\_CDR\_tag\_get/default.block
3. \c\_CDR\_tag\_get/default
4. \c\_CDR\_tag\_get/\_\_\_pygments
5. \c\_CDR\_tag\_get/\_\_\_pygments.block
6. \c\_CDR\_tag\_get/\_\_\_fancyvrb
7. \c\_CDR\_tag\_get/\_\_\_fancyvrb.block
8. \c\_CDR\_tag\_get/\_\_\_fancyvrb.all when no using pygments

---

```
\CDR_tag_if_exist_here:ccTF * \CDR_tag_if_exist_here:ccTF {⟨tag name⟩} ⟨relative key path⟩ {⟨true code⟩} {⟨false code⟩}
```

---

If the ⟨relative key path⟩ is known within ⟨tag name⟩, the ⟨true code⟩ is executed, otherwise, the ⟨false code⟩ is executed. No inheritance.

```
154 \prg_new_conditional:Nnn \CDR_tag_if_exist_here:cc { T, F, TF } {
155   \cs_if_exist:cTF { \CDR_tag_get_path:cc { #1 } { #2 } } {
156     \prg_return_true:
157   } {
158     \prg_return_false:
159   }
160 }
```

---

```
\CDR_tag_if_exist:ccTF * \CDR_tag_if_exist:ccTF {⟨tag name⟩} ⟨relative key path⟩ {⟨true code⟩} {⟨false code⟩}
\CDR_tag_if_exist:cTF * \CDR_tag_if_exist:cTF {⟨tag name⟩} ⟨relative key path⟩ {⟨true code⟩} {⟨false code⟩}
```

---

If the ⟨relative key path⟩ is known within ⟨tag name⟩, the ⟨true code⟩ is executed, otherwise, the ⟨false code⟩ is executed if none of the parents has the ⟨relative key path⟩ on its own. In the second version, the ⟨tag name⟩ is not provided and set to `__local`.

```
161 \prg_new_conditional:Nnn \CDR_tag_if_exist:cc { T, F, TF } {
162   \cs_if_exist:cTF { \CDR_tag_get_path:cc { #1 } { #2 } } {
163     \prg_return_true:
164   } {
165     \seq_if_exist:cTF { \CDR_tag_parent_seq:c { #1 } } {
166       \seq_map_tokens:cn
167         { \CDR_tag_parent_seq:c { #1 } }
168         { \CDR_tag_if_exist_f:cn { #2 } }
169     } {
170       \prg_return_false:
171     }
172 }
```

```

172 }
173 }
174 \prg_new_conditional:Nnn \CDR_tag_if_exist:c { T, F, TF } {
175   \cs_if_exist:cTF { \CDR_tag_get_path:c { #1 } } {

177   } {
178     \seq_if_exist:cTF { \CDR_tag_parent_seq:c { __local } } {
179       \seq_map_tokens:cn
180         { \CDR_tag_parent_seq:c { __local } }
181         { \CDR_tag_if_exist_f:cn { #1 } }
182     } {
183       \prg_return_false:
184     }
185   }
186 }
187 \cs_new:Npn \CDR_tag_if_exist_f:cn #1 #2 {
188   \quark_if_no_value:nTF { #2 } {
189     \seq_map_break:n {
190       \prg_return_false:
191     }
192   } {
193     \CDR_tag_if_exist:ccT { #2 } { #1 } {
194       \seq_map_break:n {
195         \prg_return_true:
196       }
197     }
198   }
199 }

```

---

\CDR_tag_get:cc *	\CDR_tag_get:cc {<tag name>} {<relative key path>}
\CDR_tag_get:c *	\CDR_tag_get:c {<relative key path>}

---

The property value stored for <tag name> and <relative key path>. Takes care of inheritance. In the second version, the <tag name> is not provided an set to \_\_local.

```

200 \cs_new:Npn \CDR_tag_get:cc #1 #2 {
201   \CDR_tag_if_exist_here:ccTF { #1 } { #2 } {
202     \use:c { \CDR_tag_get_path:cc { #1 } { #2 } }
203   } {
204     \seq_if_exist:cT { \CDR_tag_parent_seq:c { #1 } } {
205       \seq_map_tokens:cn
206         { \CDR_tag_parent_seq:c { #1 } }
207         { \CDR_tag_get_f:cn { #2 } }
208     }
209   }
210 }
211 \cs_new:Npn \CDR_tag_get_f:cn #1 #2 {
212   \quark_if_no_value:nF { #2 } {
213     \CDR_tag_if_exist_here:ccT { #2 } { #1 } {
214       \seq_map_break:n {
215         \use:c { \CDR_tag_get_path:cc { #2 } { #1 } }
216       }
217     }
218   }

```

```

219 }
220 \cs_new:Npn \CDR_tag_get:c {
221   \CDR_tag_get:cc { __local }
222 }

```

---

\CDR_tag_get:ccN	\CDR_tag_get:ccN {<tag name>} {<relative key path>} {<tl variable>}
\CDR_tag_get:cN	\CDR_tag_get:cN {<relative key path>} {<tl variable>}

---

Put in *<tl variable>* the property value stored for the *\_\_local* *<tag name>* and *<relative key path>*. In the second version, the *<tag name>* is not provided an set to *\_\_local*.

```

223 \cs_new_protected:Npn \CDR_tag_get:ccN #1 #2 #3 {
224   \tl_set:Nf #3 { \CDR_tag_get:cc { #1 } { #2 } }
225 }
226 \cs_new_protected:Npn \CDR_tag_get:cN {
227   \CDR_tag_get:ccN { __local }
228 }

```

---

\CDR_tag_get:ccNTF	\CDR_tag_get:ccNTF {<tag name>} {<relative key path>} {<tl var>} {<true code>}
\CDR_tag_get:cNTF	{<false code>}
	\CDR_tag_get:cNTF {<relative key path>} {<tl var>} {<true code>} {<false code>}

---

Getter with branching. If the *<relative key path>* is known, save the value into *<tl var>* and execute *<true code>*. Otherwise, execute *<false code>*. In the second version, the *<tag name>* is not provided an set to *\_\_local*.

```

229 \prg_new_protected_conditional:Nnn \CDR_tag_get:ccN { T, F, TF } {
230   \CDR_tag_if_exist:ccTF { #1 } { #2 } {
231     \CDR_tag_get:ccN { #1 } { #2 } #3
232     \prg_return_true:
233   } {
234     \prg_return_false:
235   }
236 }
237 \prg_new_protected_conditional:Nnn \CDR_tag_get:cN { T, F, TF } {
238   \CDR_tag_if_exist:cTF { #1 } {
239     \CDR_tag_get:cN { #1 } #2
240     \prg_return_true:
241   } {
242     \prg_return_false:
243   }
244 }

```

## 6.4 Inheritance

When a child inherits from a parent, all the keys of the parent that are not inherited are made available to the child (inheritance does not jump over generations).

---

\CDR_tag_parent_seq:c *	\CDR_tag_parent_seq:c {<tag name>}
-------------------------	------------------------------------

---

Return the name of the sequence variable containing the list of the parents. Each child has its own sequence of parents.

```

245 \cs_new:Npn \CDR_tag_parent_seq:c #1 {
246   g_CDR:parent.tag @ #1 _seq
247 }

```

---

$\backslash$ CDR_tag_inherit:cn $\backslash$ CDR_tag_inherit:(cf cV)	$\backslash$ CDR_tag_inherit:cn {<child name>} {(parent names comma list)} Set the parents of <child name> to the given list.
---	--

---

```

248 \cs_new:Npn \CDR_tag_inherit:cn #1 #2 {
249   \seq_set_from_clist:cn { \CDR_tag_parent_seq:c { #1 } } { #2 }
250   \seq_remove_duplicates:c \l_CDR_tl
251   \seq_remove_all:cn \l_CDR_tl {}
252   \seq_put_right:cn \l_CDR_tl { \q_no_value }
253 }
254 \cs_new:Npn \CDR_tag_inherit:cf {
255   \exp_args:Nnf \CDR_tag_inherit:cn
256 }
257 \cs_new:Npn \CDR_tag_inherit:cV {
258   \exp_args:NnV \CDR_tag_inherit:cn
259 }

```

## 7 Cache management

If there is no <jobname>.aux file, there should be no cached files either, coder-util.lua is asked to clean all of them, if any.

```

260 \AddToHook { begindocument/before } {
261   \IfFileExists {./\jobname.aux} {} {
262     \lua_now:n {CDR:cache_clean_all()}
263   }
264 }

```

At the end of the document, coder-util.lua is asked to clean all unused cached files that could come from a previous process.

```

265 \AddToHook { enddocument/end } {
266   \lua_now:n {CDR:cache_clean_unused()}
267 }

```

## 8 Utilities

---

$\backslash$ CDR_clist_map_inline:Nnn	$\backslash$ CDR_clist_map_inline:Nnn <clist var> {(empty code)} {(non empty code)} Execute <empty code> when the list is empty, otherwise call $\backslash$ clist_map_inline:Nn with <non empty code>.
---------------------------------------	--

---

```

268 \cs_new:Npn \CDR_clist_map_inline:Nnn #1 #2 {
269   \clist_if_empty:NTF #1 {
270     #2
271     \use_none:n
272   } {
273     \clist_map_inline:Nn #1
274   }
275 }

```

---

<code>\CDR_if_block_p: *</code>	<code>\CDR_if_block:TF {⟨true code⟩} {⟨false code⟩}</code>
<code>\CDR_if_block:TF *</code>	Execute <code>⟨true code⟩</code> when inside a code block, <code>⟨false code⟩</code> when inside an inline code. Raises an error otherwise.

---

```

276 \prg_new_conditional:Nnn \CDR_if_block: { p, T, F, TF } {
277   \PackageError
278     { coder }
279     { Conditional~not~available }
280 }

```

---

<code>\CDR_process_record:</code>	Record the current line or not. The default implementation does nothing and is meant to be defines locally.
-----------------------------------	---

---

```

281 \cs_new:Npn \CDR_process_record: {}

```

## 9 l3keys modules for code chunks

All these modules are initialized at the beginning of the document using the `__initialize` meta key.

### 9.1 Utilities

---

<code>\CDR_tag_keys_define:nn</code>	<code>\CDR_tag_keys_define:nn {⟨module base⟩} {⟨keyval list⟩}</code>
--------------------------------------	--

---

The `⟨module⟩` is uniquely based on `⟨module base⟩` before forwarding to `\keys_define:nn`.

```

282 \cs_generate_variant:Nn \keys_define:nn { Vn, xn }
283 \cs_new:Npn \CDR_tag_keys_define:nn #1 {
284   \keys_define:xn { \c_CDR_tag / \exp_not:n { #1 } }
285 }
286 \cs_generate_variant:Nn \CDR_tag_keys_define:nn { nx }

```

---

<code>\CDR_tag_keys_set:nn</code>	<code>\CDR_tag_keys_set:nn {⟨module base⟩} {⟨keyval list⟩}</code>
-----------------------------------	---

---

The `⟨module⟩` is uniquely based on `⟨module base⟩` before forwarding to `\keys_set:nn`.

```

287 \cs_new:Npn \CDR_tag_keys_set:nn #1 {
288   \exp_args:Nx
289   \keys_set:nn { \c_CDR_tag / \exp_not:n { #1 } }
290 }
291 \cs_generate_variant:Nn \CDR_tag_keys_set:nn { nV }

```

#### 9.1.1 Handling unknown tags

While using `\keys_set:nn` and variants, each time a full key path matching the pattern `\c_CDR_tag/⟨tag name⟩/⟨relative key path⟩` is not recognized, we assume that the client implicitly wants a tag with the given `⟨tag name⟩` to be defined. For that

purpose, we collect unknown keys with `\keys_set_known:nnnN` then process them to find each `<tag name>` and define the new tag accordingly. A similar situation occurs for display engine options where the full key path reads `\c_CDR_tag/<tag name>/<engine name>` engine options where `<engine name>` is not known in advance.

---

`\CDR_keys_set_known:nnN`    `\CDR_keys_set_known:nnN {<module>} {<key[=value] items>} <t1 var>`

---

Wrappers over `\keys_set_known:nnnN` where the `<root>` is also the `<module>`.

```

292 \cs_new:Npn \CDR_keys_set_known:nnN #1 #2 {
293   \keys_set_known:nnnN { #1 } { #2 } { #1 }
294 }
295 \cs_generate_variant:Nn \CDR_keys_set_known:nnN { x, VV }

```

---

`\CDR_keys_inherit:nnn`    `\CDR_keys_inherit:nnn {<tag root>} {<tag name>} {<parents comma list>}`

---

The `<tag name>` and parents are given relative to `<tag root>`. Set the inheritance.

```

296 \cs_new:Npn \CDR_keys_inherit__:nnn #1 #2 #3 {
297   \keys_define:nn { #1 } { #2 .inherit:n = { #3 } }
298 }
299 \cs_new:Npn \CDR_keys_inherit:nnn #1 #2 #3 {
300   \tl_if_empty:nTF { #1 } {
301     \CDR_keys_inherit__:nnn { } { #2 } { #3 }
302   } {
303     \clist_set:Nn \l_CDR_clist { #3 }
304     \exp_args:Nnnx
305     \CDR_keys_inherit__:nnn { #1 } { #2 } {
306       #1 / \clist_use:Nn \l_CDR_clist { ,#1/ }
307     }
308   }
309 }
310 \cs_generate_variant:Nn \CDR_keys_inherit:nnn { VnV, Vnn }

```

---

`\CDR_tag_keys_set_known:nnN`    `\CDR_tag_keys_set_known:nnN {<tag name>} {<key[=value] items>} <t1 var>`

---

Wrappers over `\keys_set_known:nnnN` where the module is given by `\c_CDR_tag/<tag name>`. *Implementation detail* the remaining arguments are absorbed by the last macro.

```

311 \cs_generate_variant:Nn \keys_set_known:nnnN { VVV, nVx }
312 \cs_new:Npn \CDR_tag_keys_set_known:nnN #1 {
313   \CDR_keys_set_known:nnN { \c_CDR_tag / \exp_not:n { #1 } }
314 }
315 \cs_generate_variant:Nn \CDR_tag_keys_set_known:nnN { nV }

```

`\c_CDR_provide_regex`    To parse a l3keys full key path.

```

316 \tl_set:Nn \l_CDR_tl { /([^\/*])(?:/(.*)?)?$ } \use_none:n { $ }
317 \tl_put_left:NV \l_CDR_tl \c_CDR_tag
318 \tl_put_left:Nn \l_CDR_tl { ^ }
319 \exp_args:NNV
320 \regex_const:Nn \c_CDR_provide_regex \l_CDR_tl

```

(End definition for `\c_CDR_provide_regex`. This variable is documented on page ??.)

---

```
\CDR_tag_provide_from_clist:n    \CDR_tag_provide_from_clist:n {(deep comma list)}
\CDR_tag_provide_from_keyval:n  \CDR_tag_provide_from_keyval:n {(key-value list)}
```

---

`<deep comma list>` has format `tag/<tag name comma list>`. Parse the `<key-value list>` for full key path matching `tag/<tag name>/<relative key path>`, then ensure that `\c_CDR_tag/<tag name>` is a known full key path. For that purpose, we use `\keyval_parse:nnn` with two `\CDR_tag_provide:` helper.

Notice that a tag name should contain no `'/`.

```
321 \regex_const:Nn \c_CDR_engine_regex { ^[/]*\sengine\soptions$ } \use_none:n { $ }
322 \cs_new:Npn \CDR_tag_provide_from_clist:n #1 {
323   \exp_args:NNx

373   }
374 }
375 \cs_generate_variant:Nn \CDR_tag_provide_from_keyval:n { V }

```

## 9.2 pygments

These are pygments's `LatexFormatter` options, that are not covered by `__fancyvrb`. They are made available at the end user level, but may not be relevant when pygments is not used.

### 9.2.1 Utilities

---

<code>\CDR_has_pygments_p: *</code> <code>\CDR_has_pygments:TF *</code>	<code>\CDR_has_pygments:TF {&lt;true code&gt;} {&lt;false code&gt;}</code> Execute <code>&lt;true code&gt;</code> when pygments is available, <code>&lt;false code&gt;</code> otherwise. <i>Implementation detail:</i> we define the conditionals and set them afterwards.
--	---

---

```

376 \sys_get_shell:nnN {which-pygmentize} {} \l_CDR_tl
377 \prg_new_conditional:Nnn \CDR_has_pygments: { p, T, F, TF } { }
378 \tl_if_in:NnTF \l_CDR_tl { pygmentize } {
379   \prg_set_conditional:Nnn \CDR_has_pygments: { p, T, F, TF } {
380     \prg_return_true:
381   }
382 } {
383   \prg_set_conditional:Nnn \CDR_has_pygments: { p, T, F, TF } {
384     \prg_return_false:
385   }
386 }

```

### 9.2.2 `__pygments` `l3keys` module

```

387 \CDR_tag_keys_define:nn { __pygments } {

```

 `lang=<language name>` where `<language name>` is recognized by pygments, including a void string,

```

388   lang .code:n = \CDR_tag_set:,
389   lang .value_required:n = true,

```

 `pygments[=true|false]` whether pygments should be used for syntax coloring. Initially true if pygments is available, false otherwise.

```

390   pygments .code:n = \CDR_tag_boolean_set:x { #1 },

```

● **style**=*<style name>* where *<style name>* is recognized by `pygments`, including a void string,

```
391 style .code:n = \CDR_tag_set:,
392 style .value_required:n = true,
```

● **commandprefix**=*<text>* The  $\text{\LaTeX}$  commands used to produce colored output are constructed using this prefix and some letters. Initially `PY`.

```
393 commandprefix .code:n = \CDR_tag_set:,
394 commandprefix .value_required:n = true,
```

● **mathescape**[*=true|false*] If set to `true`, enables  $\text{\LaTeX}$  math mode escape in comments. That is, `$...$` inside a comment will trigger math mode. Initially `false`.

```
395 mathescape .code:n = \CDR_tag_boolean_set:x { #1 },
396 mathescape .default:n = true,
```

● **escapeinside**=*<before>**<after>* If set to a string of length 2, enables escaping to  $\text{\LaTeX}$ . Text delimited by these 2 characters is read as  $\text{\LaTeX}$  code and typeset accordingly. It has no effect in string literals. It has no effect in comments if `texcomments` or `mathescape` is set. Initially empty.

```
397 escapeinside .code:n = \CDR_tag_set:,
398 escapeinside .value_required:n = true,
```

● **\_\_initialize** Initializer.

```
399 __initialize .meta:n = {
400   lang = tex,
401   pygments = \CDR_has_pygments:TF { true } { false },
402   style=default,
403   commandprefix=PY,
404   mathescape=false,
405   escapeinside=,
406 },
407 __initialize .value_forbidden:n = true,

408 }
409 \AtBeginDocument{
410   \CDR_tag_keys_set:nn { __pygments } { __initialize }
411 }
```

### 9.2.3 `\c_CDR_tag / __pygments.block l3keys` module

```
412 \CDR_tag_keys_define:nn { __pygments.block } {
```

● **texcomments**[*=true|false*] If set to `true`, enables  $\text{\LaTeX}$  comment lines. That is,  $\text{\LaTeX}$  markup in comment tokens is not escaped so that  $\text{\LaTeX}$  can render it. Initially `false`.

```
413 texcomments .code:n = \CDR_tag_boolean_set:x { #1 },
414 texcomments .default:n = true,
```

● **\_\_initialize** Initializer.

```
415 __initialize .meta:n = {
416     texcomments=false,
417 },
418 __initialize .value_forbidden:n = true,

419 }
420 \AtBeginDocument{
421     \CDR_tag_keys_set:nn { __pygments.block } { __initialize }
422 }
```

## 9.3 Specific to coder

### 9.3.1 default l3keys module

```
423 \CDR_tag_keys_define:nn { default } {
```

Keys are:

● **format**=*(format commands)* the format used to display the code (mainly font, size and color), after the font has been selected. Initially empty.

```
424 format .code:n = \CDR_tag_set:,
425 format .value_required:n = true,
```

● **cache** Set to true if coder-tool.py should use already existing files instead of creating new ones. Initially true.

```
426 cache .code:n = \CDR_tag_boolean_set:x { #1 },
```

● **debug** Set to true if various debugging messages should be printed to the console . Initially false.

```
427 debug .code:n = \CDR_tag_boolean_set:x { #1 },
```

● **post processor**=*(command)* the command for pygments post processor. This is a string where every occurrence of “%%file%%” is replaced by the full path of the \*.pyg.tex file to be post processed and then executed as terminal instruction. Initially empty.

```
428 post~processor .code:n = \CDR_tag_set:,
429 post~processor .value_required:n = true,
```

● **parskip** the value of the \parskip in code blocks,

```
430 parskip .code:n = \CDR_tag_set:,
431 parskip .value_required:n = true,
```

● **engine**=*(engine name)* to specify the engine used to display inline code or blocks. Initially default.

```
432 engine .code:n = \CDR_tag_set:,
433 engine .value_required:n = true,
```

🔴 **default engine options=***(default engine options)* to specify the corresponding options,

```
434 default~engine~options .code:n = \CDR_tag_set:,
435 default~engine~options .value_required:n = true,
```

🔴 **<engine name> engine options=***(engine options)* to specify the options for the named engine,

🔴 **\_\_initialize** to initialize storage properly. We cannot use **.initial:n** actions because the **\l\_keys\_path\_str** is not set up properly.

```
436 __initialize .meta:n = {
437   format = ,
438   cache = true,
439   debug = false,
440   post~processor = ,
441   parskip = \the\parskip,
442   engine = default,
443   default~engine~options = ,
444 },
445 __initialize .value_forbidden:n = true,

446 }
447 \AtBeginDocument{
448   \CDR_tag_keys_set:nn { default } { __initialize }
449 }
```

### 9.3.2 default.code l3keys module

Void for the moment.

```
450 \CDR_tag_keys_define:nn { default.code } {
```

Known keys include:

🔴 **\_\_initialize** to initialize storage properly. We cannot use **.initial:n** actions because the **\l\_keys\_path\_str** is not set up properly.

```
451 __initialize .meta:n = {
452 },
453 __initialize .value_forbidden:n = true,

454 }
455 \AtBeginDocument{
456   \CDR_tag_keys_set:nn { default.code } { __initialize }
457 }
```

### 9.3.3 default.block l3keys module

```
458 \CDR_tag_keys_define:nn { default.block } {
```

Known keys include:

● **show tags**[*=true|false*] to enable/disable the display of the code chunks tags. Initially *true*.

● **tags**=*<tag name comma list>* to export and display.

```
459 tags .code:n = {  
460     \clist_set:Nn \l_CDR_tags_clist { #1 }  
461     \clist_remove_duplicates:N \l_CDR_tags_clist  
462     \exp_args:NV  
463     \CDR_tag_set:n \l_CDR_tags_clist  
464 },  
465 tags .value_required:n = true,
```

● **tags format**=*<format commands>* , where *<format>* is used the format used to display the tag names (mainly font, size and color), after it is appended to the *numbers format*. Initially empty.

```
466 tags~format .code:n = \CDR_tag_set:,  
467 tags~format .value_required:n = true,
```

● **numbers format**=*<format commands>* , where *<format>* is used the format used to display line numbers (mainly font, size and color).

```
468 numbers~format .code:n = \CDR_tag_set:,  
469 numbers~format .value_required:n = true,
```

● **show tags**[*=true|false*] whether tags should be displayed.

```
470 show~tags .code:n = \CDR_tag_boolean_set:x { #1 },
```

● **only top**[*=true|false*] to avoid chunk tags repetitions, if on the same page, two consecutive code chunks have the same tag names, the second names are not displayed.

```
471 only~top .code:n = \CDR_tag_boolean_set:x { #1 },
```

● **use margin**[*=true|false*] to use the margin to display line numbers and tag names, or not,

```
472 use~margin .code:n = \CDR_tag_boolean_set:x { #1 },
```

● **blockskip** the separation with the surrounding text, above and below. Initially *\topsep*.

```
473 blockskip .code:n = \CDR_tag_set:,  
474 blockskip .value_required:n = true,
```

● **\_\_initialize** the separation with the surrounding text. Initially *\topsep*.

```
475 __initialize .meta:n = {  
476     tags = ,  
477     show~tags = true,  
478     only~top = true,  
479     use~margin = true,  
480     numbers~format = {
```

```

481     \sffamily
482     \scriptsize
483     \color{gray}
484   },
485   tags-format = {
486     \bfseries
487   },
488   blockskip = \topsep,
489 },
490 __initialize .value_forbidden:n = true,
491 }
492 \AtBeginDocument{
493   \CDR_tag_keys_set:nn { default.block } { __initialize }
494 }

```

## 9.4 fancyvrb

These are fancyvrb options verbatim. The fancyvrb manual has more details, only some parts are reproduced hereafter. All of these options may not be relevant for all situations. Some of them make no sense in code mode, whereas others may not be compatible with the display engine.

### 9.4.1 \_\_fancyvrb l3keys module

```

495 \CDR_tag_keys_define:nn { __fancyvrb } {

```

● **formatcom**=*<command>* execute before printing verbatim text. Initially empty.

```

496   formatcom .code:n = \CDR_tag_set:,
497   formatcom .value_required:n = true,

```

● **fontfamily**=*<font family name>* font family to use. tt, courier and helvetica are pre-defined. Initially tt.

```

498   fontfamily .code:n = \CDR_tag_set:,
499   fontfamily .value_required:n = true,

```

● **fontsize**=*<font size>* size of the font to use. If you use the relsize package as well, you can require a change of the size proportional to the current one (for instance: `fontsize=\relsize{-2}`). Initially auto: the same as the current font.

```

500   fontsize .code:n = \CDR_tag_set:,
501   fontsize .value_required:n = true,

```

● **fontshape**=*<font shape>* font shape to use. Initially auto: the same as the current font.

```

502   fontshape .code:n = \CDR_tag_set:,
503   fontshape .value_required:n = true,

```

● **fontseries**=*<series name>* L<sup>A</sup>T<sub>E</sub>X font series to use. Initially auto: the same as the current font.

```

504 fontseries .code:n = \CDR_tag_set:,
505 fontseries .value_required:n = true,

🔴 showspace[=true|false] print a special character representing each space. Initially
false: spaces not shown.

506 showspace .code:n = \CDR_tag_boolean_set:x { #1 },

🔴 showtab=true|false explicitly show tab characters. Initially false: tab characters
not shown.

507 showtab .code:n = \CDR_tag_boolean_set:x { #1 },

🔴 obeytab=true|false position characters according to the tabs. Initially false: tab
characters are added to the current position.

508 obeytab .code:n = \CDR_tag_boolean_set:x { #1 },

🔴 tabsize=<integer> number of spaces given by a tab character, Initially 2 (8 for fan-
cyvrb).

509 tabsize .code:n = \CDR_tag_set:,
510 tabsize .value_required:n = true,

🔴 defineactive=<macro> to define the effect of active characters. This allows to do some
devious tricks, see the fancyvrb package. Initially empty.

511 defineactive .code:n = \CDR_tag_set:,
512 defineactive .value_required:n = true,

✅ rellabel=<label> define a label to be used with \pageref. Initially empty.

513 rellabel .code:n = \CDR_tag_set:,
514 rellabel .value_required:n = true,

✅ __initialize Initialization.

515 __initialize .meta:n = {
516   formatcom = ,
517   fontfamily = tt,
518   fontsize = auto,
519   fontseries = auto,
520   fontshape = auto,
521   showspace = false,
522   showtab = false,
523   obeytab = false,
524   tabsize = 2,
525   defineactive = ,
526   rellabel = ,
527 },
528 __initialize .value_forbidden:n = true,

529 }
530 \AtBeginDocument{
531   \CDR_tag_keys_set:nn { __fancyvrb } { __initialize }
532 }

```

## 9.4.2 `__fancyvrb.block` keys module

Block specific options, except numbering.

```
533 \regex_const:Nn \c_CDR_integer_regex { ^(+|-)?\d+$ } \use_none:n { $ }
534 \CDR_tag_keys_define:nn { __fancyvrb.block } {
```

- **frame**=`none|leftline|topline|bottomline|lines|single` type of frame around the verbatim environment. With `leftline` and `single` modes, a space of a length given by the  $\text{\LaTeX}$  `\fboxsep` macro is added between the left vertical line and the text. Initially `none`: no frame.

```
535   frame .choices:nn =
536     { none, leftline, topline, bottomline, lines, single }
537     { \CDR_tag_choices_set: },
```

- **framerule**=`<dimension>` width of the rule of the frame if any. Initially 0.4pt.

```
538   framerule .code:n = \CDR_tag_set:,
539   framerule .value_required:n = true,
```

- **framesep**=`<dimension>` width of the gap between the frame (if any) and the text. Initially `\fboxsep`.

```
540   framesep .code:n = \CDR_tag_set:,
541   framesep .value_required:n = true,
```

- **rulecolor**=`<color command>` color of the frame rule, expressed in the standard  $\text{\LaTeX}$  way. Initially black.

```
542   rulecolor .code:n = \CDR_tag_set:,
543   rulecolor .value_required:n = true,
```

- **rulefillcolor**=`<color command>` color used to fill the space between the frame and the text (its thickness is given by `framesep`). Initially empty.

```
544   fillcolor .code:n = \CDR_tag_set:,
545   fillcolor .value_required:n = true,
```

- **label**=`{[<top string>]<string>}` label(s) to print on top, bottom or both, frame lines. If the label(s) contains special characters, comma or equal sign, it must be placed inside a group. If an optional `<top string>` is given between square brackets, it will be used for the top line and `<string>` for the bottom line. Otherwise, `<string>` is used for both the top or bottom lines. Label(s) are printed only if the **frame** parameter is one of `topline`, `bottomline`, `lines` or `single`. Initially empty: no label.

```
546   label .code:n = \CDR_tag_set:,
547   label .value_required:n = true,
```

- **labelposition**=`none|topline|bottomline|all` position where to print the label(s) when defined. When options happen to be contradictory, like `frame=topline` and `labelposition=bottomline`, nothing is displayed. Initially `none` when no labels are defined, `topline` for one label and `all` otherwise.

```

548   labelposition .choices:nn =
549     { none, topline, bottomline, all }
550     { \CDR_tag_choices_set: },

```

- **baselinestretch=auto** $\langle dimension \rangle$  value to give to the usual `\baselinestretch`  $\text{\LaTeX}$  parameter. Initially `auto`: its current value just before the verbatim command.

```

551   baselinestretch .code:n = \CDR_tag_set:,
552   baselinestretch .value_required:n = true,

```

- **commandchars=three characters** characters which define the character which starts a macro and marks the beginning and end of a group; thus lets us introduce escape sequences in verbatim code. Of course, it is better to choose special characters which are not used in the verbatim text. Private to `coder`, unavailable to users.

- **xleftmargin=dimension** indentation to add at the start of each line. Initially `Opt`: no left margin.

```

553   xleftmargin .code:n = \CDR_tag_set:,
554   xleftmargin .value_required:n = true,

```

- **xrightmargin=dimension** right margin to add after each line. Initially `Opt`: no right margin.

```

555   xrightmargin .code:n = \CDR_tag_set:,
556   xrightmargin .value_required:n = true,

```

- **resetmargins[=true|false]** reset the left margin, which is useful if we are inside other indented environments. Initially `true`.

```

557   resetmargins .code:n = \CDR_tag_boolean_set:x { #1 },

```

- **hfuzz=dimension** value to give to the  $\text{\TeX}$  `\hfuzz` dimension for text to format. This can be used to avoid seeing some unimportant overfull box messages. Initially `2pt`.

```

558   hfuzz .code:n = \CDR_tag_set:,
559   hfuzz .value_required:n = true,

```

- **samepage[=true|false]** in very special circumstances, we may want to make sure that a verbatim environment is not broken, even if it does not fit on the current page. To avoid a page break, we can set the `samepage` parameter to `true`. Initially `false`.

```

560   samepage .code:n = \CDR_tag_boolean_set:x { #1 },

```

- ✓ **\_\_initialize** Initialization.

```

561   __initialize .meta:n = {
562     frame = none,
563     label = ,
564     labelposition = none,% auto?
565     baselinestretch = auto,

```

```

566     resetmargins = true,
567     xleftmargin = 0pt,
568     xrightmargin = 0pt,
569     hfuzz = 2pt,
570     samepage = false,
571   },
572   __initialize .value_forbidden:n = true,

573 }
574 \AtBeginDocument{
575   \CDR_tag_keys_set:nn { __fancyvrb.block } { __initialize }
576 }

```

### 9.4.3 `__fancyvrb.number l3keys` module

Block line numbering.

```

577 \CDR_tag_keys_define:nn { __fancyvrb.number } {

```

● **commentchar**=*<character>* lines starting with this character are ignored. Initially empty.

```

578   commentchar .code:n = \CDR_tag_set:,
579   commentchar .value_required:n = true,

```

● **gobble**=*<integer>* number of characters to suppress at the beginning of each line (from 0 to 9), mainly useful when environments are indented. Only `block` mode.

```

580   gobble .choices:nn = {
581     0,1,2,3,4,5,6,7,8,9
582   } {
583     \CDR_tag_choices_set:
584   },

```

● **numbers**=*none|left|right* numbering of the verbatim lines. If requested, this numbering is done outside the verbatim environment. Initially `none`: no numbering.

```

585   numbers .choices:nn =
586     { none, left, right }
587     { \CDR_tag_choices_set: },

```

● **numbersep**=*<dimension>* gap between numbers and verbatim lines. Initially 12pt.

```

588   numbersep .code:n = \CDR_tag_set:,
589   numbersep .value_required:n = true,

```

● **firstnumber**=*auto|last|<integer>* number of the first line. `last` means that the numbering is continued from the previous verbatim environment. If an integer is given, its value will be used to start the numbering. Initially `auto`: numbering starts from 1.

```

590 firstnumber .code:n = {
591   \regex_match:NnTF \c_CDR_integer_regex { #1 } {
592     \CDR_tag_set:
593   } {
594     \str_case:nnF { #1 } {
595       { auto } { \CDR_tag_set: }
596       { last } { \CDR_tag_set: }
597     } {
598       \PackageWarning
599         { CDR }
600         { Value-‘#1’~not~in~auto,~last. }
601     }
602   }
603 },
604 firstnumber .value_required:n = true,

```

● **stepnumber**=*<integer>* interval at which line numbers are printed. Initially 1: all lines are numbered.

```

605 stepnumber .code:n = \CDR_tag_set:,
606 stepnumber .value_required:n = true,

```

● **numberblanklines**[=true|false] to number or not the white lines (really empty or containing blank characters only). Initially true: all lines are numbered.

```

607 numberblanklines .code:n = \CDR_tag_boolean_set:x { #1 },

```

● **firstline**=*<integer>* first line to print. Initially empty: all lines from the first are printed.

```

608 firstline .code:n = \CDR_tag_set:,
609 firstline .value_required:n = true,

```

● **lastline**=*<integer>* last line to print. Initially empty: all lines until the last one are printed.

```

610 lastline .code:n = \CDR_tag_set:,
611 lastline .value_required:n = true,

```

✓ **\_\_initialize** Initialization.

```

612 __initialize .meta:n = {
613   commentchar = ,
614   gobble = 0,
615   numbers = left,
616   numbersep = 1ex,
617   firstnumber = auto,
618   stepnumber = 1,
619   numberblanklines = true,
620   firstline = ,
621   lastline = ,
622 },
623 __initialize .value_forbidden:n = true,

```

```

624 }
625 \AtBeginDocument{
626   \CDR_tag_keys_set:nn { __fancyvrb.number } { __initialize }
627 }

```

#### 9.4.4 `__fancyvrb.all` `l3keys` module

Options available when `pygments` is not used.

```

628 \CDR_tag_keys_define:nn { __fancyvrb.all } {

```

- **`commandchars`**=*(three characters)* characters that define the character that starts a macro and marks the beginning and end of a group; allows to introduce escape sequences in the verbatim code. Of course, it is better to choose special characters that are not used in the verbatim text! Initially **`none`**. Ignored in `pygments` mode.

```

629   commandchars .code:n = \CDR_tag_set:,
630   commandchars .value_required:n = true,

```

- **`codes`**=*(macro)* to specify catcode changes. For instance, this allows us to include formatted mathematics in verbatim text. Initially empty. Ignored in `pygments` mode.

```

631   codes .code:n = \CDR_tag_set:,
632   codes .value_required:n = true,

```

- ✓ **`__initialize`** Initialization.

```

633   __initialize .meta:n = {
634     commandchars = ,
635     codes = ,
636   },
637   __initialize .value_forbidden:n = true,
638 }
639 \AtBeginDocument{
640   \CDR_tag_keys_set:nn { __fancyvrb.all } { __initialize }
641 }

```

## 10 `\CDRSet`

---

```

\CDRSet {key[=value] list}
\CDRSet {only description=true, font family=tt}
\CDRSet {tag/default.code/font family=sf}

```

---

To set up the package. This is executed at least once at the end of the preamble. The unique mandatory argument of `\CDRSet` is a list of *(key)*[=*(value)*] items defined by the `CDR@Set` `l3keys` module.

## 10.1 CDR@Set l3keys module

```
642 \keys_define:nn { CDR@Set } {
```

- **only description** to typeset only the description section and ignore the implementation section.

```
643   only~description .choices:nn = { false, true, {} } {
644     \int_compare:nNnTF \l_keys_choice_int = 1 {
645       \prg_set_conditional:Nnn \CDR_if_only_description: { p, T, F, TF } { \prg_return_true: }
646     } {
647       \prg_set_conditional:Nnn \CDR_if_only_description: { p, T, F, TF } { \prg_return_false: }
648     }
649   },
650   only~description .initial:n = false,
```

- **python path** if automatic processing is not available, manually setting the path to the python utility is required. Giving a void path forces an automatic guess using which.

```
651   python-path .code:n = {
652     \str_set:Nn \l_CDR_str { #1 }
653     \lua_now:n { CDR:set_python_path('l_CDR_str') }
654   },
655 }
```

## 10.2 Branching

---

```
\CDR_if_only_description_p: * \CDR_if_only_description:TF {<true code>} {<false code>}
\CDR_if_only_description:TF *
```

---

Execute *<true code>* when only the description is expected, *<false code>* otherwise.  
*Implementation detail:* the functions are defined as part of the CDR@Set l3keys module.

## 10.3 Implementation

---

```
\CDR_check_unknown:N \CDR_check_unknown:N {<tl variable>}
```

---

In normal situation, the argument is expected to be empty. When the argument is not empty, send a package warning for each key.

```
656 \exp_args_generate:n { xV, nnV }
657 \cs_new:Npn \CDR_check_unknown:N #1 {
658   \tl_if_empty:NF #1 {
659     \cs_set:Npn \CDR_check_unknown:n ##1 {
660       \PackageWarning
661         { coder }
662         { Unknow~key~'##1' }
663     }
664     \cs_set:Npn \CDR_check_unknown:nn ##1 ##2 {
665       \CDR_check_unknown:n { ##1 }
```

```

666     }
667     \exp_args:NnnV
668     \keyval_parse:nnn {
669         \CDR_check_unknown:n
670     } {
671         \CDR_check_unknown:nn
672     } #1
673 }
674 }

675 \NewDocumentCommand \CDRSet { m } {
676     \CDR_keys_set_known:nnN { CDR@Set } { #1 } \l_CDR_keyval_tl
677     \clist_map_inline:nn {
678         __pygments, __pygments.block,
679         default.block, default.code, default,
680         __fancyvrb, __fancyvrb.block, __fancyvrb.all
681     } {
682         \CDR_tag_keys_set_known:nVN { ##1 } \l_CDR_keyval_tl \l_CDR_keyval_tl
683     }
684     \CDR_keys_set_known:VVN \c_CDR_Tags \l_CDR_keyval_tl \l_CDR_keyval_tl
685     \CDR_tag_provide_from_keyval:V \l_CDR_keyval_tl
686     \CDR_keys_set_known:VVN \c_CDR_Tags \l_CDR_keyval_tl \l_CDR_keyval_tl
687     \CDR_tag_keys_set:nV { default } \l_CDR_keyval_tl
688 }

```

## 11 \CDRExport

---

**\CDRExport**    \CDRExport {<key[=value] controls>}

---

The <key>[=<value>] controls are defined by CDR@Export l3keys module.

### 11.1 Storage

---

**\CDR\_export\_get\_path:cc** ★    \CDR\_tag\_export\_path:cc {<file name>} {<relative key path>}

---

Internal: return a unique key based on the arguments. Used to store and retrieve values.

```

689 \cs_new:Npn \CDR_export_get_path:cc #1 #2 {
690     CDR @ export @ get @ #1 / #2
691 }

```

---

**\CDR\_export\_set:ccn**    \CDR\_export\_set:ccn {<file name>} {<relative key path>} {<value>}

---

**\CDR\_export\_set:Vcn**    Store <value>, which is further retrieved with the instruction \CDR\_get\_get:cc {<file name>} {<relative key path>}. All the affectations are made at the current T<sub>E</sub>X group level.

---

**\CDR\_export\_set:VcV**

---

```

692 \cs_new_protected:Npn \CDR_export_set:ccn #1 #2 #3 {
693     \cs_set:cpn { \CDR_export_get_path:cc { #1 } { #2 } } { \exp_not:n { #3 } }
694 }
695 \cs_new_protected:Npn \CDR_export_set:Vcn #1 {

```

```

696 \exp_args:NV
697 \CDR_export_set:ccn { #1 }
698 }
699 \cs_new_protected:Npn \CDR_export_set:VcV #1 #2 #3 {
700 \exp_args:NVnV
701 \CDR_export_set:ccn #1 { #2 } #3
702 }

```

---

```

\CDR_export_if_exist:ccTF * \CDR_export_if_exist:ccTF {<file name>} <relative key path> {<true code>}
                           {<false code>}

```

---

If the *<relative key path>* is known within *<file name>*, the *<true code>* is executed, otherwise, the *<false code>* is executed.

```

703 \prg_new_conditional:Nnn \CDR_export_if_exist:cc { p, T, F, TF } {
704 \cs_if_exist:cTF { \CDR_export_get_path:cc { #1 } { #2 } } {
705 \prg_return_true:
706 } {
707 \prg_return_false:
708 }
709 }

```

---

```

\CDR_export_get:cc * \CDR_export_get:cc {<file name>} {<relative key path>}

```

---

The property value stored for *<file name>* and *<relative key path>*.

```

710 \cs_new:Npn \CDR_export_get:cc #1 #2 {
711 \CDR_export_if_exist:ccT { #1 } { #2 } {
712 \use:c { \CDR_export_get_path:cc { #1 } { #2 } }
713 }
714 }

```

---

```

\CDR_export_get:ccNTF \CDR_export_get:ccNTF {<file name>} {<relative key path>}
                     <tl var> {<true code>} {<false code>}

```

---

Get the property value stored for *<file name>* and *<relative key path>*, copy it to *<tl var>*. Execute *<true code>* on success, *<false code>* otherwise.

```

715 \prg_new_protected_conditional:Nnn \CDR_export_get:ccN { T, F, TF } {
716 \CDR_export_if_exist:ccTF { #1 } { #2 } {
717 \tl_set:Nx #3 { \CDR_export_get:cc { #1 } { #2 } }
718 \prg_return_true:
719 } {
720 \prg_return_false:
721 }
722 }

```

## 11.2 Storage

`\g_CDR_export_prop` Global storage for *<file name>=<file export info>*

```

723 \prop_new:N \g_CDR_export_prop

```

(End definition for `\g_CDR_export_prop`. This variable is documented on page ??.)

`\l_CDR_file_tl` Store the file name used for exportation, used as key in the above property list.

```
724 \tl_new:N \l_CDR_file_tl
```

(End definition for `\l_CDR_file_tl`. This variable is documented on page ??.)

`\l_CDR_tags_clist` Used by `CDR@Export l3keys` module to temporarily store tags during the export declaration.  
`\g_CDR_tags_clist`

```
725 \clist_new:N \l_CDR_tags_clist
```

```
726 \clist_new:N \g_CDR_tags_clist
```

(End definition for `\l_CDR_tags_clist` and `\g_CDR_tags_clist`. These variables are documented on page ??.)

`\l_CDR_export_prop` Used by `CDR@Export l3keys` module to temporarily store properties. *Nota Bene*: nothing similar with `\g_CDR_export_prop` except the name.

```
727 \prop_new:N \l_CDR_export_prop
```

(End definition for `\l_CDR_export_prop`. This variable is documented on page ??.)

### 11.3 CDR@Export l3keys module

No initial value is given for every key. An `__initialize` action will set the storage with proper initial values.

```
728 \keys_define:nn { CDR@Export } {
```

● **file**=`<name>` the output file name, must be provided otherwise an error is raised.

```
729   file .tl_set:N = \l_CDR_file_tl,
```

```
730   file .value_required:n = true,
```

● **tags**=`<tags comma list>` the list of tags. No exportation when this list is void. Initially empty.

```
731   tags .code:n = {
```

```
732     \clist_set:Nn \l_CDR_tags_clist { #1 }
```

```
733     \clist_remove_duplicates:N \l_CDR_tags_clist
```

```
734     \prop_put:NV \l_CDR_prop \l_keys_key_str \l_CDR_tags_clist
```

```
735   },
```

```
736   tags .value_required:n = true,
```

● **lang** one of the languages `pygments` is aware of. Initially `tex`.

```
737   lang .code:n = {
```

```
738     \prop_put:NVn \l_CDR_prop \l_keys_key_str { #1 }
```

```
739   },
```

```
740   lang .value_required:n = true,
```

● **preamble** the added preamble. Initially empty.

```

741 preamble .code:n = {
742   \prop_put:NVn \l_CDR_prop \l_keys_key_str { #1 }
743 },
744 preamble .value_required:n = true,

```

🔴 **postamble** the added postamble. Initially empty.

```

745 postamble .code:n = {
746   \prop_put:NVn \l_CDR_prop \l_keys_key_str { #1 }
747 },
748 postamble .value_required:n = true,

```

🔴 **raw[=true|false]** true to remove any additional material, false otherwise. Initially false.

```

749 raw .choices:nn = { false, true, {} } {
750   \prop_put:NVx \l_CDR_prop \l_keys_key_str {
751     \int_compare:nNnTF
752       \l_keys_choice_int = 1 { false } { true }
753   }
754 },

```

✅ **\_\_initialize** Meta key to properly initialize all the variables.

```

755 __initialize .meta:n = {
756   __initialize_prop = #1,
757   file=,
758   tags=,
759   lang=tex,
760   preamble=,
761   postamble=,
762   raw=false,
763 },
764 __initialize .default:n = \l_CDR_export_prop,

```

✅ **\_\_initialize\_prop** Goody: properly initialize the local property storage.

```

765 __initialize_prop .code:n = \prop_clear:N #1,
766 __initialize_prop .value_required:n = true,
767 }

```

## 11.4 Implementation

```

768 \NewDocumentCommand \CDRExport { m } {
769   \keys_set:nn { CDR@Export } { __initialize }
770   \keys_set:nn { CDR@Export } { #1 }
771   \tl_if_empty:NTF \l_CDR_file_tl {
772     \PackageWarning
773       { coder }
774       { Missing~key~‘file’ }
775   } {
776     \CDR_export_set:VcV \l_CDR_file_tl { file } \l_CDR_file_tl
777     \prop_map_inline:Nn \l_CDR_prop {
778       \CDR_export_set:Vcn \l_CDR_file_tl { ##1 } { ##2 }
779     }

```

The list of tags must not be empty, raise an error otherwise. Records the list in `\g_CDR_tags_clist`, it will be the default list of forthcoming code blocks.

```

780 \tl_if_empty:NTF \l_CDR_tags_clist {
781   \PackageWarning
782     { coder }
783     { Missing-key~‘tags’ }
784 } {
785   \clist_set_eq:NN \g_CDR_tags_clist \l_CDR_tags_clist
786   \CDR_export_set:VcV \l_CDR_file_tl { file } \l_CDR_file_tl

```

If a `lang` is given, forwards the declaration to all the code chunks tagged within `\l_CDR_tags_clist`.

```

787   \exp_args:NV
788   \CDR_export_get:ccNT \l_CDR_file_tl { lang } \l_CDR_tl {
789     \clist_map_inline:Nn \l_CDR_tags_clist {
790       \CDR_tag_set:ccV { ##1 } { lang } \l_CDR_tl
791     }
792   }
793 }
794 }
795 }

```

Files are created at the end of the typesetting process.

```

796 \AddToHook { enddocument / end } {
797   \prop_map_inline:Nn \g_CDR_export_prop {
798     \tl_set:Nn \l_CDR_prop { #2 }
799     \str_set:Nx \l_CDR_str {
800       \prop_item:Nn \l_CDR_prop { file }
801     }
802     \lua_now:n { CDR:export_file('l_CDR_str') }
803     \clist_map_inline:nn {
804       tags, raw, preamble, postamble
805     } {
806       \str_set:Nx \l_CDR_str {
807         \prop_item:Nn \l_CDR_prop { ##1 }
808       }
809       \lua_now:n {
810         CDR:export_file_info('##1', 'l_CDR_str')
811       }
812     }
813     \lua_now:n { CDR:export_file_complete() }
814   }
815 }

```

## 12 Style

`pygments`, through `coder-tool.py`, creates style commands, but the storage is managed on the  $\text{\LaTeX}$  side by `coder.sty`. This is a  $\text{\LaTeX}$  style API.

---

```

\CDR@StyleDefine \CDR@StyleDefine {<pygments style name>} {<definitions>}

```

---

Define the definitions for the given `<pygments style name>`.

```

816 \cs_set:Npn \CDR@StyleDefine #1 {
817   \tl_gset:cn { g_CDR@Style/#1 }
818 }

```

---

<code>\CDR@StyleUse</code>	<code>\CDR@StyleUse {&lt;pygments style name&gt;}</code>
<code>CDR@StyleUseTag</code>	<code>\CDR@StyleUseTag</code>

---

Use the definitions for the given *<pygments style name>*. No safe check is made. The `\CDR@StyleUseTag` version finds the *<pygments style name>* from the context. It is defined locally.

```

819 \cs_set:Npn \CDR@StyleUse #1 {
820   \tl_use:c { g_CDR@Style/#1 }
821 }

```

---

<code>\CDR@StyleExist</code>	<code>\CDR@StyleExist {&lt;pygments style name&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
------------------------------	---

---

Execute *<true code>* if a style exists with that given name, *<false code>* otherwise.

```

822 \prg_new_conditional:Nnn \CDR@StyleIfExist:c { TF } {
823   \tl_if_exist:cTF { g_CDR@Style/#1 } {
824     \prg_return_true:
825   } {
826     \prg_return_false:
827   }
828 }
829 \cs_set_eq:NN \CDR@StyleIfExist \CDR@StyleIfExist:cTF

```

## 13 Creating display engines

### 13.1 Utilities

---

<code>\CDR_code_engine:c</code>	<code>\CDR_code_engine:c {&lt;engine name&gt;}</code>
<code>\CDR_code_engine:V</code>	<code>\CDR_block_engine:c {&lt;engine name&gt;}</code>
<code>\CDR_block_engine:c</code>	<code>\CDR_code_engine:c</code> builds a command sequence name based on <i>&lt;engine name&gt;</i> .
<code>\CDR_block_engine:V</code>	<code>\CDR_block_engine:c</code> builds an environment name based on <i>&lt;engine name&gt;</i> .

---

```

830 \cs_new:Npn \CDR_code_engine:c #1 {
831   CDR@colored/code/#1:nn
832 }
833 \cs_new:Npn \CDR_block_engine:c #1 {
834   CDR@colored/block/#1
835 }
836 \cs_new:Npn \CDR_code_engine:V {
837   \exp_args:NV \CDR_code_engine:c
838 }
839 \cs_new:Npn \CDR_block_engine:V {
840   \exp_args:NV \CDR_block_engine:c
841 }

```

`\l_CDR_engine_tl` Storage for an engine name.

842 \tl\_new:N \l\_CDR\_engine\_tl

(End definition for \l\_CDR\_engine\_tl. This variable is documented on page ??.)

---

\CDRGetOption    \CDRGetOption {<relative key path>}

---

Returns the value given to \CDRCode command or CDRBlock environment for the <relative key path>. This function is only available during \CDRCode execution and inside CDRBlock environment.

## 13.2 Implementation

---

\CDRCodeEngineNew    \CDRCodeEngineNew {<engine name>}{<engine body>}  
\CDRCodeEngineRenew   \CDRCodeEngineRenew{<engine name>}{<engine body>}

---

<engine name> is a non void string, once expanded. The <engine body> is a list of instructions which may refer to the first argument as #1, which is the value given for key <engine name> engine options, and the second argument as #2, which is the colored code.

```

843 \NewDocumentCommand \CDRCodeEngineNew { mm } {
844   \exp_args:Nx

---

**\CDR@CodeEngineApply**    \CDR@CodeEngineApply {<source>}

---

Get the code engine and apply it to the given <source>. When the code engine is not recognized, an error is raised. *Implementation detail:* the argument is parsed by the last macro.

```

878 \cs_new:Npn \CDR@CodeEngineApply #1 {
879   \CDR_tag_get:cN { engine } \l_CDR_engine_tl
880   \CDR_if_code_engine:VF \l_CDR_engine_tl {
881     \PackageError
882       { coder }
883       { \l_CDR_engine_tl\space code~engine~unknown,~replaced-by~'default' }
884       {See~\CDRCodeEngineNew~in~the~coder~manual}
885     \tl_set:Nn \l_CDR_engine_tl { default }
886   }
887   \CDR_tag_get:cN { engine~options } \l_CDR_options_tl
888   \tl_if_empty:NTF \l_CDR_options_tl {
889     \CDR_tag_get:cN { \l_CDR_engine_tl\space engine~options } \l_CDR_options_tl
890   } {
891     \tl_put_left:Nx \l_CDR_options_tl {
892       \CDR_tag_get:c { \l_CDR_engine_tl\space engine~options } ,
893     }
894   }
895   \exp_args:NnV
896   \use:c { \CDR_code_engine:V \l_CDR_engine_tl } \l_CDR_options_tl {
897     \CDR_tag_get:c { format }
898     #1
899   }
900 }

```

---

**\CDRBlockEngineNew**    \CDRBlockEngineNew {<engine name>} {<begin instructions>} {<end instructions>}

---

**\CDRBlockEngineRenew**    \CDRBlockEngineRenew {<engine name>} {<begin instructions>} {<end instructions>}

---

Create a L<sup>A</sup>T<sub>E</sub>X environment uniquely named after <engine name>, which must be a non void string once expanded. The <begin instructions> and <end instructions> are list of instructions which may refer to the unique argument as #1, which is the value given to CDRBlock environment for key <engine name> engine options. Various options are available with the \CDRGetOption function. *Implementation detail:* the third argument is parsed by \NewDocumentEnvironment.

```

901 \NewDocumentCommand \CDRBlockEngineNew { mm } {
902   \NewDocumentEnvironment { \CDR_block_engine:c { #1 } } { m } {
903     \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
904     #2
905   }
906 }

907 \NewDocumentCommand \CDRBlockEngineRenew { mm } {
908   \tl_if_empty:NTF { #1 } {
909     \PackageWarning

```

```

910     { coder }
911     { The~engine~cannot~be~void. }
912     \use_none:n
913 } {
914   \RenewDocumentEnvironment { \CDR_block_engine:c { #1 } } { m } {
915     \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
916     #2
917   }
918 }
919 }

```

### 13.3 Conditionals

---

\CDR\_if\_code\_engine:cTF ★ \CDR\_if\_code\_engine:cTF {<engine name>} {<true code>} {<false code>}

---

If there exists a code engine with the given <engine name>, execute <true code>. Otherwise, execute <false code>.

```

920 \prg_new_conditional:Nnn \CDR_if_code_engine:c { p, T, F, TF } {
921   \cs_if_exist:cTF { \CDR_code_engine:c { #1 } } {
922     \prg_return_true:
923   } {
924     \prg_return_false:
925   }
926 }
927 \prg_new_conditional:Nnn \CDR_if_code_engine:V { p, T, F, TF } {
928   \cs_if_exist:cTF { \CDR_code_engine:V #1 } {
929     \prg_return_true:
930   } {
931     \prg_return_false:
932   }
933 }

```

---

\CDR\_if\_block\_engine:cTF ★ \CDR\_if\_block\_engine:c {<engine name>} {<true code>} {<false code>}

---

If there exists a block engine with the given <engine name>, execute <true code>, otherwise, execute <false code>.

```

934 \prg_new_conditional:Nnn \CDR_if_block_engine:c { p, T, F, TF } {
935   \cs_if_exist:cTF { \CDR_block_engine:c { #1 } } {
936     \prg_return_true:
937   } {
938     \prg_return_false:
939   }
940 }
941 \prg_new_conditional:Nnn \CDR_if_block_engine:V { p, T, F, TF } {
942   \cs_if_exist:cTF { \CDR_block_engine:V #1 } {
943     \prg_return_true:
944   } {
945     \prg_return_false:
946   }
947 }

```

## 13.4 Default code engine

The default code engine does nothing special and forwards its argument as is.

```
948 \CDRCodeEngineNew { default } { #2 }
```

## 13.5 Default block engine

The default block engine does nothing.

```
949 \CDRBlockEngineNew { default } { } { }
```

## 13.6 efbox code engine

```
950 \AtBeginDocument {  
951   \ifpackageloaded{efbox} {  
952     \CDRCodeEngineNew {efbox} {  
953       \efbox[#1]{#2}%  
954     }  
955   }  
956 }
```

## 13.7 Block mode default engine

```
957 \CDRBlockEngineNew {} {  
958 } {  
959 }
```

## 13.8 tcolorbox related engine

If the tcolorbox is loaded, related code and block engines are available.

# 14 \CDRCode function

## 14.1 API

---

<code>\CDRCode</code>	<code>\CDRCode{&lt;key[=value]&gt;}&lt;delimiter&gt;&lt;code&gt;&lt;same delimiter&gt;</code>
-----------------------	---

Public method to declare inline code.

## 14.2 Storage

`\l_CDR_tag_tl` To store the tag given.

```
960 \tl_new:N \l_CDR_tag_tl
```

*(End definition for \l\_CDR\_tag\_tl. This variable is documented on page ??.)*

### 14.3 `__code l3keys` module

This is the module used to parse the user interface of the `\CDRCode` command.

```
961 \CDR_tag_keys_define:nn { __code } {
```

✔ **tag=<name>** to use the settings of the already existing named tag to display.

```
962   tag .tl_set:N = \l_CDR_tag_tl,
963   tag .value_required:n = true,
```

⬢ **engine options=<engine options>** options forwarded to the engine. They are appended to the options given with key *<engine name>* engine options.

```
964   engine~options .code:n = \CDR_tag_set:,
965   engine~options .value_required:n = true,
```

⬢ **\_\_initialize** initialize

```
966   __initialize .meta:n = {
967     tag = default,
968     engine~options = ,
969   },
970   __initialize .value_forbidden:n = true,
971 }
```

### 14.4 Implementation

---

```
\CDR_code_format: \CDR_code_format:
```

---

Private utility to setup the formatting.

```
972 \cs_new:Npn \CDR_brace_if_contains_comma:n #1 {
973   \tl_if_in:nnTF { #1 } { , } { { #1 } } { #1 }
974 }
975 \cs_generate_variant:Nn \CDR_brace_if_contains_comma:n { V }
976 \cs_new:Npn \CDR_code_format: {
977   \frenchspacing
978   \CDR_tag_get:cN { baselinestretch } \l_CDR_tl
979   \tl_if_eq:NnF \l_CDR_tl { auto } {
980     \exp_args:NNV
981     \def \baselinestretch \l_CDR_tl
982   }
983   \CDR_tag_get:cN { fontfamily } \l_CDR_tl
984   \tl_if_eq:NnT \l_CDR_tl { tt } { \tl_set:Nn \l_CDR_tl { lmtt } }
985   \exp_args:NV
986   \fontfamily \l_CDR_tl
987   \clist_map_inline:nn { series, shape } {
988     \CDR_tag_get:cN { font##1 } \l_CDR_tl
989     \tl_if_eq:NnF \l_CDR_tl { auto } {
990       \exp_args:NnV
991       \use:c { font##1 } \l_CDR_tl
992     }
993   }
```

```

993 }
994 \CDR_tag_get:cN { fontsize } \l_CDR_tl
995 \tl_if_eq:NnF \l_CDR_tl { auto } {
996   \tl_use:N \l_CDR_tl
997 }
998 \selectfont
999 % \@noligs ?? this is in fancyvrb but does not work here as is
1000 }

```

---

```

\CDR_code:n \CDR_code:n <delimiter>

```

---

Main utility used by \CDRCode.

```

1001 \cs_new:Npn \CDR_code:n #1 {

## 15 CDRBlock environment

`CDRBlock`      `\begin{CDRBlock}{<key[=value] list>} ... \end{CDRBlock}`

## 15.1 Storage

`\l_CDR_block_prop`

1088 `\prop_new:N \l_CDR_block_prop`

*(End definition for \l\_CDR\_block\_prop. This variable is documented on page ??.)*

## 15.2 `__block l3keys` module

This module is used to parse the user interface of the `CDRBlock` environment.

1089 `\CDR_tag_keys_define:nn { __block } {`

● `no export[=true|false]` to ignore this code chunk at export time.

1090 `no-export .code:n = \CDR_tag_boolean_set:x { #1 },`

1091 `no-export .default:n = true,`

● `no export format=<format commands>` a format appended to `tags format` and `numbers format` when `no export` is true.. Initially empty.

1092 `no-export~format .code:n = \CDR_tag_set:,`

1093 `no-export~format .value_required:n = true,`

● `test[=true|false]` whether the chunk is a test,

1094 `test .code:n = \CDR_tag_boolean_set:x { #1 },`

1095 `test .default:n = true,`

● `engine options=<engine options>` options forwarded to the engine. They are appended to the options given with key `<engine name>` engine options. Mainly a convenient user interface shortcut.

1096 `engine-options .code:n = \CDR_tag_set:,`

1097 `engine-options .value_required:n = true,`

● `__initialize initialize`

1098 `__initialize .meta:n = {`

1099 `no-export = false,`

1100 `no-export-format = ,`

1101 `test = false,`

1102 `engine-options = ,`

1103 `},`

1104 `__initialize .value_forbidden:n = true,`

1105 `}`

## 15.3 Context

Inside the `CDRBlock` environments, some local variables are available:

● `\l_CDR_tags_clist`

## 15.4 Implementation

We start by saving some fancyvrb macros that we further want to extend. The unique mandatory argument of these macros will eventually be recorded to be saved later on.

```

1106 \clist_map_inline:nn { i, ii, iii, iv } {
1107   \cs_set_eq:cc { CDR@ListProcessLine@ #1 } { FV@ListProcessLine@ #1 }
1108 }
1109 \cs_new:Npn \CDR_process_line:n #1 {
1110   \str_set:Nn \l_CDR_str { #1 }
1111   \lua_now:n {CDR:record_line('l_CDR_str')}
1112 }

1113 \def\FVB@CDRBlock #1 {
1114   \@bsphack
1115   \group_begin:
1116   \prg_set_conditional:Nnn \CDR_if_block: { p, T, F, TF } {
1117     \prg_return_true:
1118   }
1119   \CDR_tag_keys_set:nn { __block } { __initialize }

```

By default, this code chunk will have the same list of tags as the last code block or last \CDRExport stored in \g\_CDR\_tags\_clist.

```

1120 \clist_set_eq:NN \l_CDR_tags_clist \g_CDR_tags_clist
1121 \CDR_keys_inherit:Vnn \c_CDR_tag { __local } {
1122   __block, __pygments.block, default.block,
1123   __pygments, default,
1124 }
1125 \exp_args:NnV
1126 \CDR_tag_keys_set_known:nnN { __local } \FV@KeyValues \l_CDR_keyval_tl
1127 \CDR_tag_provide_from_keyval:V \l_CDR_keyval_tl
1128 \exp_args:NnV
1129 \CDR_tag_keys_set_known:nnN { __local } \l_CDR_keyval_tl \l_CDR_keyval_tl
1130 \clist_if_empty:NT \l_CDR_tags_clist {
1131   \PackageWarning
1132   { coder }
1133   { No~(default)~tags~provided }
1134 }

```

\l\_CDR\_pygments\_bool is true iff one of the tags needs pygments.

```

1135 \clist_map_inline:Nn \l_CDR_tags_clist {
1136   \CDR_if_truthy:ccT { ##1 } { pygments } {
1137     \clist_map_break:n {
1138       \bool_set_true:N \l_CDR_pygments_bool
1139     }
1140   }
1141 }
1142 \bool_if:NTF \l_CDR_pygments_bool {
1143   \CDR_keys_inherit:Vnn \c_CDR_tag { __local } {
1144     __fancyvrb.number
1145   }
1146   \CDR_tag_keys_set_known:nVN { __local } \l_CDR_keyval_tl \l_CDR_keyval_tl
1147   \exp_args:NV \fvset \l_CDR_keyval_tl
1148   \CDR_keys_inherit:Vnn \c_CDR_tag { __local } {

```

```

1149     __fancyvrb, __fancyvrb.block
1150 }
1151 \exp_args:NnV
1152 \CDR_tag_keys_set:nn { __local } \l_CDR_keyval_tl

```

Get the list of tags and setup coder-util.lua for recording or highlighting.

```

1153 \CDR_tag_inherit:cf { __local } {
1154     \l_CDR_tags_clist,

```

## 17 More

---

`\CDR_if_record:TF` ★ `\CDR_if_record:TF {⟨true code⟩} {⟨false code⟩}`

---

Execute *⟨true code⟩* when code should be recorded, *⟨false code⟩* otherwise. The code should be recorded for the CDRBlock environment when there is a non empty list of tags and pigments is used. *Implementation details:* we assume that if `\l_CDR_tags_clist` is not empty then we are in a CDRBlock environment.

```

1247 \prg_new_conditional:Nnn \CDR_if_record: { T, F, TF } {
1248   \clist_if_empty:NTF \l_CDR_tags_clist {
1249     \prg_return_false:

## 18 Management

`\g_CDR_in_impl_bool` Whether we are currently in the implementation section.

```
1454 \bool_new:N \g_CDR_in_impl_bool
```

(End definition for `\g_CDR_in_impl_bool`. This variable is documented on page ??.)

---

`\CDR_if_show_code:TF` `\CDR_if_show_code:TF {⟨true code⟩} {⟨false code⟩}`

Execute *⟨true code⟩* when code should be printed, *⟨false code⟩* otherwise.

```

1455 \prg_new_conditional:Nnn \CDR_if_show_code: { T, F, TF } {
1456     \bool_if:nTF {
1457         \g_CDR_in_impl_bool && !\g_CDR_with_impl_bool
1458     } {
1459         \prg_return_false:
1460     } {
1461         \prg_return_true:
1462     }
1463 }

```

`\g_CDR_with_impl_bool`

```
1464 \bool_new:N \g_CDR_with_impl_bool
```

(End definition for `\g_CDR_with_impl_bool`. This variable is documented on page ??.)

## 19 minted and pygments

`\g_CDR_minted_on_bool` Whether minted is available, initially set to `false`.

```
1465 \bool_new:N \g_CDR_minted_on_bool
      (End definition for \g_CDR_minted_on_bool. This variable is documented on page ??.)
```

`\g_CDR_use_minted_bool` Whether minted is used, initially set to `false`.

```
1466 \bool_new:N \g_CDR_use_minted_bool
      (End definition for \g_CDR_use_minted_bool. This variable is documented on page ??.)
```

---

```
\CDR_if_use_minted:TF \CDR_if_use_minted:TF {<true code>} {<false code>}
      Execute <true code> when using minted, <false code> otherwise.

1467 \prg_new_conditional:Nnn \CDR_if_use_minted: { T, F, TF } {
1468   \bool_if:NTF \g_CDR_use_minted_bool
1469     { \prg_return_true: }
1470     { \prg_return_false: }
1471 }
```

---

`\_CDR_minted_on:` `\_CDR_minted_on:`

Private function. During the preamble, loads `minted`, sets `\g_CDR_minted_on_bool` to `true` and prepares `pygments` processing.

```
1472 \cs_set:Npn \_CDR_minted_on: {
1473   \bool_gset_true:N \g_CDR_minted_on_bool
1474   \RequirePackage{minted}
1475   \setkeys{ minted@opt@g } { linenos=false }
1476   \minted@def@opt{post~processor}
1477   \minted@def@opt{post~processor~args}
1478   \pretocmd\minted@inputpyg{
1479     \CDR@postprocesspyg {\minted@outputdir\minted@infile}
1480   }{\fail}
```

In the execution context of `\minted@inputpyg`,

**#1** is the name of the python script, e.g., “`process.py`”

**#2** is the input “`.pygtex`” file “`\minted@outputdir\minted@infile`”

**#3** are more args passed to the python script, possibly empty

```
1481 \newcommand{\CDR@postprocesspyg}[1]{%
1482   \group_begin:
1483   \tl_set:Nx \l_tmpa_tl {\CDR:n { post_processor } }
1484   \tl_if_empty:NF \l_tmpa_tl {
```

Execute ‘`python3 <script.py> <file.pygtex> <more_args>`’

```

1485 \tl_set:Nx \l_tmpb_tl {\CDR:n { post_processor_args } }
1486 \exp_args:Nx
1487 \sys_shell_now:n {
1488   python3\space
1489   \l_tmpa_tl\space
1490   ##1\space
1491   \l_tmpb_tl
1492 }
1493 }
1494 \group_end:
1495 }
1496 }

1497 %\AddToHook { begindocument / end } {
1498 % \cs_set_eq:NN \_CDR_minted_on: \prg_do_nothing:
1499 %}

```

Utilities to setup pygments post processing. The pygments post processor marks some code with `\CDREmph`.

```

1500 \ProvideDocumentCommand{\CDREmph}{m}{\textcolor{red}{#1}}

```

---

<code>\CDRPreamble</code>	<code>\CDRPreamble {&lt;variable&gt;} {&lt;file name&gt;}</code>
---------------------------	--

Store the content of *<file name>* into the variable *<variable>*.

```

1501 \DeclareDocumentCommand \CDRPreamble { m m } {
1502   \msg_info:nnn
1503   { coder }
1504   { :n }
1505   { Reading-preamble-from-file-"#2". }
1506   \group_begin:
1507   \tl_set:Nn \l_tmpa_tl { #2 }
1508   \exp_args:NNNx
1509   \group_end:
1510   \tl_set:Nx #1 { \lua_now:n {CDR.print_file_content('l_tmpa_tl')} }
1511 }

```

## 20 Section separators

---

<code>\CDRImplementation</code>	<code>\CDRImplementation</code>
<code>\CDRFinale</code>	<code>\CDRFinale</code>

`\CDRImplementation` start an implementation part where all the sectioning commands do nothing, whereas `\CDRFinale` stop an implementation part.

## 21 Finale

```

1512 \newcounter{CDR@impl@page}

## 25 Counters

---

<code>\CDR_int_new:nn</code>	<code>\CDR_int_new:n {&lt;name&gt;} {&lt;value&gt;}</code>
------------------------------	--

---

Create an integer after  $\langle name \rangle$  and set it globally to  $\langle value \rangle$ .  $\langle name \rangle$  is a code name.

```

1930 \cs_new:Npn \CDR_int_new:nn #1 #2 {
1931   \int_new:c {g/CDR/int/#1}
1932   \int_gset:cn {g/CDR/int/#1} { #2 }
1933 }
```

---

<code>\CDR_int_set:nn</code>	<code>\CDR_int_set:n {&lt;name&gt;} {&lt;value&gt;}</code>
<code>\CDR_int_gset:nn</code>	

---

Set the integer named after  $\langle name \rangle$  to the  $\langle value \rangle$ . `\CDR_int_gset:n` makes a global change.  $\langle name \rangle$  is a code name.

```

1934 \cs_new:Npn \CDR_int_set:nn #1 #2 {
1935   \int_set:cn {g/CDR/int/#1} { #2 }
1936 }
1937 \cs_new:Npn \CDR_int_gset:nn #1 #2 {
1938   \int_gset:cn {g/CDR/int/#1} { #2 }
1939 }
```

---

<code>\CDR_int_add:nn</code>	<code>\CDR_int_add:n {&lt;name&gt;} {&lt;value&gt;}</code>
<code>\CDR_int_gadd:nn</code>	

---

Add the  $\langle value \rangle$  to the integer named after  $\langle name \rangle$ . `\CDR_int_gadd:n` makes a global change.  $\langle name \rangle$  is a code name.

```

1940 \cs_new:Npn \CDR_int_add:nn #1 #2 {
1941   \int_add:cn {g/CDR/int/#1} { #2 }
1942 }
1943 \cs_new:Npn \CDR_int_gadd:nn #1 #2 {
1944   \int_gadd:cn {g/CDR/int/#1} { #2 }
1945 }
```

---

<code>\CDR_int_sub:nn</code>	<code>\CDR_int_sub:n {&lt;name&gt;} {&lt;value&gt;}</code>
<code>\CDR_int_gsub:nn</code>	

---

Subtract the  $\langle value \rangle$  from the integer named after  $\langle name \rangle$ . `\CDR_int_gsub:n` makes a global change.  $\langle name \rangle$  is a code name.

```

1946 \cs_new:Npn \CDR_int_sub:nn #1 #2 {
1947   \int_sub:cn {g/CDR/int/#1} { #2 }
1948 }
1949 \cs_new:Npn \CDR_int_gsub:nn #1 #2 {
1950   \int_gsub:cn {g/CDR/int/#1} { #2 }
1951 }
```

---

\CDR\_int\_if\_exist:nTF \CDR\_int\_if\_exist:nTF {<name>} {<true code>} {<false code>}

Execute <true code> when an integer named after <name> exist, <false code> otherwise.

```

1952 \prg_new_conditional:Nnn \CDR_int_if_exist:n { T, F, TF } {
1953   \int_if_exist:cTF {g/CDR/int/#1} {
1954     \prg_return_true:
1955   } {
1956     \prg_return_false:
1957   }
1958 }
```

\g/CDR/int/ Generic and named line number counter. \l\_CDR\_code\_name\_t is used as <name>.

\g/CDR/int/<name>  
1959 \CDR\_int\_new:nn {} { 1 }

(End definition for \g/CDR/int/ and \g/CDR/int/<name>. These variables are documented on page ??.)

---

\CDR\_int\_use:n \* \CDR\_int\_use:n {<name>}

<name> is a code name.

```

1960 \cs_new:Npn \CDR_int_use:n #1 {
1961   \int_use:c {g/CDR/int/#1}
1962 }
```

```

1963 \ExplSyntaxOff
