

`coder` — code inlined in a \LaTeX document^{*}

Jérôme LAURENS[†]

Released 2022/02/07

Abstract

Usually, documentation is put inside the code, `coder` allows to work the other way round by putting code inside the documentation. This is particularly interesting when different code files share some logic and should be documented all at once. The file `coder-manual` gives different examples. Here is the implementation of the package.

This \LaTeX package requires `LuaTeX` and may use syntax coloring based on `pygments`.

1 Package dependencies

`luacode`, `datetime2`, `xcolor`, `fancyvrb` and dependencies of these packages.

2 Similar technologies

The `docstrip` utility offers similar features, it is somehow more powerful than `coder` at the cost of more technicality and less practicality,

The `ydoc.cls` and `skdoc.cls` are full document classes with similar features but many more that are unrelated. `coder` focuses on code inlining and interfaces very well with `pygments` for a smart syntax highlighting.

3 Known bugs and limitations

- `coder` does not play well with `docstrip`.

4 Namespace and conventions

\LaTeX identifiers related to `coder` start with `CDR`, including both commands and environments. `expl3` identifiers also start with `CDR`, after and eventual leading `c_`, `l_` or `g_`. `l3keys` module path's first component is either `CDR` or starts with `CDR@`.

`lua` objects (functions and variables) are collected in the `CDR` table automatically created while loading `coder-util.lua` from `coder.sty`.

^{*}This file describes version 2022/02/07, last revised 2022/02/07.

[†]E-mail: jerome.laurens@u-bourgogne.fr

The `c` argument specifier is used here in a more general acception. Normally, it means that the argument is turned to a command sequence name. Here, it means that the argument is a part of something bigger which is turned to a command sequence name.

5 Presentation

`coder` is a triptych of three complementary components

1. `coder.sty`, on the \LaTeX side,
2. `coder-util.lua`, to store data and call `coder-tool.py`,
3. `coder-tool.py`, to color code with the help of `pygment`.

`coder.sty` mainly declares the `\CDRCode` command and the `CDRBlock` environment. The former allows to insert code chunks as running text whereas the latter allows to insert code snippets as blocks. Moreover, both code chunks can be exported to files, once declared with `\CDRExport` command. The `\CDRSet` command is used to set various parameters, including display engines declared with either `\CDRNewCodeEngine` or `\CDRNewBlockEngine`.

5.1 Code flow

The normal code flow is

1. from `coder.sty`, \LaTeX parses a code snippet as `\CDRCode` argument of `CDRBlock` environment body, somehow stores it, and calls either `CDR:highlight_code` or `CDR:highlight_block`,
2. `coder-util.lua` reads the content of some command, and store it in a `json` file, together with informations to process this code snippet properly,
3. `coder-tool.py` is asked by `coder-util.lua` to read the `json` file and eventually uses `pygments` to translate the code snippet into dedicated \LaTeX coloring commands. These are stored in a `*.pyg.tex` file named after the md5 digest of the original code chunk, a `*.pyg.sty` \LaTeX style file is recorded as well. On return, `coder-tool.py` gives to `coder-util.lua` some \LaTeX instructions to both input the `*.pyg.sty` and the `*.pyg.tex` file, these are finally executed and the code is displayed with colors. `coder-tool.py` is also partially responsible of code line numbering.

`coder.sty` only exchanges with `coder.sty` using `\directlua` and `tex.print`. `coder-tool.py` in turn only exchanges with `coder.sty`: we put in `coder-tool.py` as few \LaTeX logic as possible. It receives instructions from `coder.sty` as command line arguments, options, `pygments` options and `fancyvrb` options.

5.2 File exports

1. The `\CDRExport` command declares a file path, a list of tags and other useful information like a coding language. These data are saved as export records by `coder-util.lua`.
2. When some `tags={...}` have been given to the `CDRBlock` environment, the `coder-util.lua` records the corresponding code chunk and its associate tags for later save.

3. Once the typesetting process is complete, `coder-util.lua`'s `CDR_export_...` methods are called to save all the files externally. For each export record, `coder-util.lua` collects all the chunks with the same tag and save them at the proper location.

5.3 Display engine

The display management is partly delegated to other packages. `coder.sty` provides default engines for running code and code blocks, and new engines can be declared with `\CDRNewCodeEngine` and `\CDRNewBlockEngine`.

5.4 L^AT_EX user interface

The first required argument of both commands and environment is a `<key[=value] controls>` list managed by `l3keys`. Each command requires its own `l3keys` module but some `<key[=value] controls>` are shared between modules.

5.5 Properties and inheritance

Properties cover various informations, from the language of the code, to the color and font. They are uniquely identified by a path, and may be defined at the *global* level or at the *tag* level.

the *global* level is set by `\CDRSet` and `\CDRExport`, it consists of global variables,

the *tag* level is set by `\CDRSet`, `\CDRCode` and `CDRBlock` environment.

Each processed code chunk has a list of associate tags. Most tag inherits from default ones.

6 Options

Key-value options allow the user, `coder.sty`, `coder-util.lua` and `CDRPy` to exchange data. What the user is allowed to do is detailed in [coder-manual.pdf](#).

6.1 fancyvrb

These are `fancyvrb` options verbatim. The `fancyvrb` manual has more details, only some parts are reproduced hereafter. All of these options may not be relevant for all situations. Some of them make no sense in `code` mode, whereas others may not be compatible with the display engine.

- **formatcom**=`<command>` execute before printing verbatim text. Initially empty. Ignored in `code` mode.
- **fontfamily**=`<family name>` font family to use. `tt`, `courier` and `helvetica` are pre-defined. Initially `tt`.
- **fontsize**=`` size of the font to use. If you use the `relsize` package as well, you can require a change of the size proportional to the current one (for instance: `fontsize=\relsize{-2}`). Initially `auto`: the same as the current font.

- **fontshape**=** font shape to use. Initially **auto**: the same as the current font.
- **showspaces**[=**true**|**false**] print a special character representing each space. Initially **false**: spaces not shown.
- **showtabs**=**true**|**false** explicitly show tab characters. Initially **false**: tab characters not shown.
- **obeytabs**=**true**|**false** position characters according to the tabs. Initially **false**: tab characters are added to the current position.
- **tabsize**=*<integer>* number of spaces given by a tab character, Initially 2 (8 for **fancyvrb**).
- **defineactive**=*<macro>* to define the effect of active characters. This allows to do some devious tricks, see the **fancyvrb** package. Initially empty.
- ✓ **relabel**=*<label>* define a label to be used with **\pageref**. Initially empty.
- **commentchar**=*<character>* lines starting with this character are ignored. Initially empty.
- **gobble**=*<integer>* number of characters to suppress at the beginning of each line (from 0 to 9), mainly useful when environments are indented. Only **block** mode.
- **frame**=**none**|**leftline**|**topline**|**bottomline**|**lines**|**single** type of frame around the verbatim environment. With **leftline** and **single** modes, a space of a length given by the L^AT_EX **\fboxsep** macro is added between the left vertical line and the text. Initially **none**: no frame.
- **label**={ [*<top string>*] *<string>* } label(s) to print on top, bottom or both, frame lines. If the label(s) contains special characters, comma or equal sign, it must be placed inside a group. If an optional *<top string>* is given between square brackets, it will be used for the top line and *<string>* for the bottom line. Otherwise, *<string>* is used for both the top or bottom lines. Label(s) are printed only if the **frame** parameter is one of **topline**, **bottomline**, **lines** or **single**. Initially empty: no label.
- **labelposition**=**none**|**topline**|**bottomline**|**all** position where to print the label(s) when defined. When options happen to be contradictory, like **frame=topline** and **labelposition=bottomline**, nothing is displayed. Initially **none** when no labels are defined, **topline** for one label and **all** otherwise.
- **numbers**=**none**|**left**|**right** numbering of the verbatim lines. If requested, this numbering is done outside the verbatim environment. Initially **none**: no numbering.
- **numbersep**=*<dimension>* gap between numbers and verbatim lines. Initially 12pt.
- **firstnumber**=**auto**|**last**|*<integer>* number of the first line. **last** means that the numbering is continued from the previous verbatim environment. If an integer is given, its value will be used to start the numbering. Initially **auto**: numbering starts from 1.

- **stepnumber**=*<integer>* interval at which line numbers are printed. Initially 1: all lines are numbered.
- **numberblanklines**[=*true|false*] to number or not the white lines (really empty or containing blank characters only). Initially **true**: all lines are numbered.
- **firstline**=*<integer>* first line to print. Initially empty: all lines from the first are printed.
- **lastline**=*<integer>* last line to print. Initially empty: all lines until the last one are printed.
- **baselinestretch**=*auto|<dimension>* value to give to the usual `\baselinestretch` L^AT_EX parameter. Initially **auto**: its current value just before the verbatim command.
- ⊘ **commandchars**=*<three characters>* characters which define the character which starts a macro and marks the beginning and end of a group; thus lets us introduce escape sequences in verbatim code. Of course, it is better to choose special characters which are not used in the verbatim text. Private to **coder**, unavailable to users.
- **xleftmargin**=*<dimension>* indentation to add at the start of each line. Initially **0pt**: no left margin.
- **xrightmargin**=*<dimension>* right margin to add after each line. Initially **0pt**: no right margin.
- **resetmargins**[=*true|false*] reset the left margin, which is useful if we are inside other indented environments. Initially **true**.
- **hfuzz**=*<dimension>* value to give to the T_EX `\hfuzz` dimension for text to format. This can be used to avoid seeing some unimportant overfull box messages. Initially **2pt**.
- **samepage**[=*true|false*] in very special circumstances, we may want to make sure that a verbatim environment is not broken, even if it does not fit on the current page. To avoid a page break, we can set the **samepage** parameter to **true**. Initially **false**.

6.2 pygments options

These are **pygments**'s `LatexFormatter` options, used only by `coder-util.lua` to communicate with `coder-tool.py`.

- **style**=*<name>* the **pygments** style to use. Initially **default**.
- ⊘ **full** Tells the formatter to output a **full** document, i.e. a complete self-contained document (default: **false**). Forbidden.
- ⊘ **title** If **full** is true, the title that should be used to caption the document (default empty). Forbidden.
- ⊘ **encoding** If given, must be an encoding name. This will be used to convert the Unicode token strings to byte strings in the output. If it is `or None`, Unicode strings will be written to the output file, which most file-like objects do not support (default: `None`).

- 🚫 **outencoding** Overrides `encoding` if given.
- 🚫 **docclass** If the `full` option is enabled, this is the document class to use (default: `article`). Forbidden.
- 🚫 **preamble** If the `full` option is enabled, this can be further preamble commands, e.g. `"\usepackage"` (default `empty`). Forbidden.
- 🚫 **linenos[=true|false]** If set to `true`, output line numbers. Initially `false`: no numbering. Ignored in `code` mode.
- 🚫 **linenostart=<integer>** The line number for the first line. Initially 1: numbering starts from 1. Ignored in `code` mode.
- 🚫 **linenostep=<integer>** If set to a number $n > 1$, only every n th line number is printed. Ignored in `code` mode. Additional options given to the `Verbatim` environment (see the `fancyvrb` docs for possible values). Initially `empty`.
- 🚫 **verboptions** Forbidden.
- 🔴 **commandprefix=<text>** The LaTeX commands used to produce colored output are constructed using this prefix and some letters. Initially `PY`.
- 🔴 **texcomments[=true|false]** If set to `true`, enables LaTeX comment lines. That is, LaTeX markup in comment tokens is not escaped so that LaTeX can render it. Initially `false`. Ignored in `code` mode.
- 🔴 **mathescape[=true|false]** If set to `true`, enables LaTeX math mode escape in comments. That is, `$...$` inside a comment will trigger math mode. Initially `false`.
- 🔴 **escapeinside=<before><after>** If set to a string of length 2, enables escaping to LaTeX. Text delimited by these 2 characters is read as LaTeX code and typeset accordingly. It has no effect in string literals. It has no effect in comments if `texcomments` or `mathescape` is set. Initially `empty`.
- ⚙️ **envname=<name>** Allows you to pick an alternative environment name replacing `Verbatim`. The alternate environment still has to support `Verbatim`'s option syntax. Initially `Verbatim`.

6.3 LaTeX

These are options used by `coder.sty` to pass data to `coder-tool.py`. All values are required, possibly empty.

- 🔴 **tags** `clist` of tag names, used for line numbering.
- 🔴 **inline** `true` when inline code is concerned, `false` otherwise.
- 🔴 **already_style** `true` when the style has already been defined, `false` otherwise,
- 🔴 **sty_template** LaTeX source text where `<placeholder:style_defs>` must be replaced by the style definitions provided by `pygments`. It may include the style name.
- 🔴 **code_template** LaTeX source text where `<placeholder:highlighted>` should be replaced by the highlighted code provided by `pygments`.

- **block_template** L^AT_EX source text where `<placeholder:count>` should be replaced by the count of numbered lines (not all lines may be numbered) and `<placeholder:highlighted>` should be replaced by the highlighted code provided by `pygments`.

All the line templates below are L^AT_EX source text where `<placeholder:number>` should be replaced by a line number and `<placeholder:line>` should be replaced by the highlighted line code provided by `pygments`. They should not include a trailing newline char.

- **single_line_template** It may contain tag related information and number as well. When the block consists of only one line.
- **first_line_template** When the block consists of more than one line. If the tag information is required or new, display only the tag. Display the number if required, otherwise.
- **second_line_template** If the first line did not, display the line number, but only when required.
- **black_line_template** for numbered lines,
- **white_line_template** for unnumbered lines,

File I

coder-util.lua implementation

1 Usage

This lua library is loaded by `coder.sty` with the instruction `CDR=require(coder-util)`. In the sequel, the syntax to call class methods and instance methods are presented with either a `CDR.` or a `CDR:` prefix. This is what is used in the library for convenience. Of course either a `self.` or a `self:` prefix would be possible.

2 Declarations

```

1 %<*lua>
2 local lfs    = _ENV.lfs
3 local tex    = _ENV.tex
4 local token  = _ENV.token
5 local rep    = string.rep
6 local lpeg   = require("lpeg")
7 local P, Cg, Cp, V = lpeg.P, lpeg.Cg, lpeg.Cp, lpeg.V
8 require("lualibs.lua")
9 local json   = _ENV.utilities.json

```

3 General purpose material

`CDR_PY_PATH` Location of the `coder-tool.py` utility. This will cause an error if `kpsewhich` is not available. The PATH must be properly set up.

```

10 local CDR_PY_PATH = io.popen(
11   [[kpsewhich coder-tool.py]]
12 ):read('a'):match("^%s*(.)%s*$")

```

(End definition for CDR_PY_PATH. This variable is documented on page ??.)

escape $\langle \text{variable} \rangle = \text{CDR.escape}(\langle \text{string} \rangle)$

 Escape the given string. NEVER USED.

```

13 local function escape(s)
14   s = s:gsub('\\', '\\\\')
15   s = s:gsub('\r', '\\r')
16   s = s:gsub('\n', '\\n')
17   s = s:gsub('"', '\\\"')
18   return s
19 end

```

make_directory $\langle \text{variable} \rangle = \text{CDR.make_directory}(\langle \text{string path} \rangle)$

Make a directory at the given path.

```

20 local function make_directory(path)
21   local mode,_,__ = lfs.attributes(path,"mode")
22   if mode == "directory" then
23     return true
24   elseif mode ~= nil then
25     return nil,path.." exist and is not a directory",1
26   end
27   if os["type"] == "windows" then
28     path = path:gsub("/", "\\")
29     __,__,__ = os.execute(
30       "if not exist " .. path .. "\\nul " .. "mkdir " .. path
31     )
32   else
33     __,__,__ = os.execute("mkdir -p " .. path)
34   end
35   mode = lfs.attributes(path,"mode")
36   if mode == "directory" then
37     return true
38   end
39   return nil,path.." exist and is not a directory",1
40 end

```

dir_p The directory where the auxiliary pygments related files are saved, in general $\langle \text{jobname} \rangle.\text{pygd}/$.

(End definition for dir_p. This variable is documented on page ??.)

json_p The path of the JSON file used to communicate with coder-tool.py, in general $\langle \text{jobname} \rangle.\text{pygd}/\langle \text{jobname} \rangle$

(End definition for json_p. This variable is documented on page ??.)

```

41 local dir_p, json_p
42 local jobname = tex.jobname
43 dir_p = './'..jobname..'pygd/'
44 if make_directory(dir_p) == nil then
45   dir_p = './'
46   json_p = dir_p..jobname..'pyg.json'
47 else
48   json_p = dir_p..'input.pyg.json'
49 end

```

print_file_content CDR.print_file_content(*<macro name>*)

The command named *<macro name>* contains the path to a file. Read the content of that file and print the result to the T_EX stream.

```

50 local function print_file_content(name)
51   local p = token.get_macro(name)
52   local fh = assert(io.open(p, 'r'))
53   s = fh:read('a')
54   fh:close()
55   tex.print(s)
56 end

```

load_exec CDR.load_exec(*<lua code chunk>*)

Class method. Loads the given *<lua code chunk>* and execute it. On error, messages are printed.

```

57 local function load_exec(chunk)
58   local func, err = load(chunk)
59   if func then
60     local ok, err = pcall(func)
61     if not ok then
62       print("coder-util.lua Execution error:", err)
63       print('chunk:', chunk)
64     end
65   else
66     print("coder-util.lua Compilation error:", err)
67     print('chunk:', chunk)
68   end
69 end

```

safe_equals *<variable>* = safe_equals(*<string>*)

Class method. Returns an *<=...=>* string as *<ans>* exactly composed of sufficiently many = signs such that *<string>* contains neither sequence [*<ans>*] nor [*<ans>*].

```

70 local eq_pattern = P({ Cp() * P('=')^1 * Cp() + 1 * V(1) })
71 local function safe_equals(s)
72   local i, j = 0, 0
73   local max = 0
74   while true do

```

```

75     i, j = eq_pattern:match(s, j)
76     if i == nil then
77         return rep("'", max + 1)
78     end
79     i = j - i
80     if i > max then
81         max = i
82     end
83 end
84 end

```

load_exec_output CDR:load_exec_output(*lua code chunk*)

Instance method to parse the *lua code chunk* string for commands and execute them. The patterns being searched are enclosed within opening <<<<< and closing >>>>>, each containing 5 characters,

?TEX:<TeX instructions> the <TeX instructions> are executed asynchronously once the control comes back to T_EX.

!LUA:<!Lua instructions> the <!Lua instructions> are executed synchronously. When not properly designed, these instruction may cause a forever loop on execution, for example, they must not use CDR:highlight_code.

?LUA:<?Lua instructions> these <?Lua instructions> are executed asynchronously once the control comes back to T_EX through a call to \directlua, which means that they will wait until any previous asynchronous <?TeX instructions> or <?Lua instructions> completes.

```

85 local parse_pattern
86 do
87     local tag = P('!'') + '?'
88     local stp = '>>>>>'
89     local cmd = P(1)^0 - stp
90     parse_pattern = P({
91         '<<<<<' * Cg(tag - 'LUA:') * ':' * Cg(cmd) * stp * Cp() + 1 * V(1)
92     })
93 end
94 local function load_exec_output(self, s)
95     local i, tag, cmd
96     i = 0
97     while true do
98         tag, cmd, i = parse_pattern:match(s, i)
99         if tag == '!' then
100             self.load_exec(cmd)
101         elseif tag == '?' then
102             local eqs = self.safe_equals(cmd)
103             cmd = '['..eqs..'['..cmd..'['..eqs..'['
104             tex.print([[
105 \directlua{CDR:load_exec([])..cmd..[]}]%
106 ]])
107         else
108             return

```

```

109     end
110   end
111 end

```

4 Properties

This is one of the channels from `coder.sty` to `coder-util.lua`.

options_reset `CDR:options_reset()`

Instance method. This is called by `coder.sty`'s `\CDR_to_lua`.

```

112 local function options_reset(self)
113   self['.options'] = {}
114 end

```

option_add `CDR:option_add(<key>, <value name>)`

Instance method. This is called by `coder.sty`'s `\CDR_to_lua`.

```

115 local function option_add(self, key, value_name)
116   local p = self['.options']
117   p[key] = token.get_macro(assert(value_name))
118 end

```

5 Hiligting

5.1 Code

highlight_code `CDR:highlight_code(<code var>)`

Highlight the code in `str` variable named `<code var name>`. Build a configuration table with all data necessary for the processing, save it as a JSON file and launch `coder-tool.py` with the proper arguments.

```

119 local function highlight_code(self, code_name)
120   local code = assert(tex.token(assert(code_name)))
121   local config = {
122     ['__cls__'] = 'Arguments'
123   }
124   local texopts = {
125     ['__cls__'] = 'TeXOpts'
126   }
127   texopts.sty_template = [[
128 \makeatletter
129 \CDR@StyleDefine {}..pygopts.style..{} {%
130 <placeholder:style_defs>%
131 }%
132 \makeatother
133 ]]
134   texopts.white_line_template = [[<placeholder:line>]]

```

```

135 texopts.black_line_template = [[
136   \CDR@Number{<placeholder:number>><placeholder:line>}]
137 texopts.single_line_template = [[\CDR@Number{<placeholder:number>><placeholder:line>}]
138 texopts.first_line_template = [[<placeholder:line>]]
139 texopts.second_line_template = [[<placeholder:line>]]
140 config['texopts'] = texopts
141 local fv_opts = {
142   ['__cls__'] = 'FVOpts'
143 }
144 config['fv_opts'] = fv_opts
145 local pyg_opts = {
146   ['__cls__'] = 'PygOpts'
147 }
148 config['pyg_opts'] = pyg_opts
149
150 end

```

5.2 Block

process_block_new CDR:process_block_new(*<tags clist>*)

Records the *<tags clist>* to prepare block highlighting.

```

151 local function process_block_new(self, tags_clist)
152   local t = {}
153   for tag in string.gmatch(tags_clist, '([^\,]+)') do
154     t[#t+1]=tag
155   end
156   self['block tags'] = tags_clist
157   self['.lines'] = {}
158 end

```

process_line CDR:process_line(*<line variable name>*)

Store the content of the given named variable.

```

159 local function process_line(self, line_variable_name)
160   local line = assert(tex.token(assert(line_variable_name)))
161   local ll = self['.lines']
162   ll[#ll+1] = line
163   local lt = self['lines by tag'] or {}
164   self['lines by tag'] = lt
165   for tag in self['block tags']:gmatch('([^\,]+)') do
166     ll = lt[tag] or {}
167     lt[tag] = ll
168     ll[#ll+1] = line
169   end
170 end

```

highlight_code CDR:highlight_block(*<block var name>*)

Highlight the code in *str* variable named *<block var name>*. Build a configuration table with all data necessary for the processing, save it as a JSON file and launch `coder-tool.py` with the proper arguments.

```

171 local function hilight_block(self, block_name)
172 end

```

6 Exportation

For each file to be exported, `coder.sty` calls `export_file` to initialte the exportation. Then it calls `export_file_info` to share the `tags`, `raw`, `preamble`, `postamble` data. Finally, `export_complete` is called to complete the exportation.

export_file CDR:export_file(*<file name var>*)

This is called at export time. *<file name var>* is the name of an `str` variable containing the file name.

```

173 local function export_file(self, file_name)
174   self['.name'] = assert(tex.token(assert(file_name)))
175   self['.export'] = {}
176 end

```

export_file_info CDR:export_file_info(*<key>*, *<value name var>*)

This is called at export time. *<value name var>* is the name of an `str` variable containing the value.

```

177 local function export_file_info(self, key, value)
178   local export = self['.export']

206 self['.exportation'] = nil
207 end

```

7 Caching

We save some computation time by pygmentizing files only when necessary. The `codertool.py` is expected to create a `*.pyg.sty` file for a style and a `*.pyg.tex` file for highlighted code. These files are cached during one whole L^AT_EX run and possibly between different L^AT_EX runs. Lua keeps track of both the style files created and highlighted code files created.

<code>cache_clean_all</code>	<code>CDR:cache_clean_all()</code>
<code>cache_record</code>	<code>CDR:cache_record(<i><style name.pyg.sty></i>, <i><digest.pyg.tex></i>)</code>
<code>cache_clean_unused</code>	<code>CDR:cache_clean_unused()</code>

Instance methods. `cache_clean_all` removes any file in the cache directory named `<jobname>.pygd`. This is automatically executed at the beginning of the document processing when there is no aux file. This can also be executed on demand with `\directlua{CDR:cache_clean_all()}`. The `cache_record` method stores both `<style name.pyg.sty>` and `<digest.pyg.tex>`. These are file names relative to the `<jobname>.pygd` directory. `cache_clean_unused` removes any file in the cache directory `<jobname>.pygd` except the ones that were previously recorded. This is executed at the end of the document processing.

```

208 local function cache_clean_all(self)
209   local to_remove = {}
210   for f in lfs.dir(dir_p) do
211     to_remove[f] = true
212   end
213   for k,_ in pairs(to_remove) do
214     os.remove(dir_p .. k)
215   end
216 end
217 local function cache_record(self, style, colored)
218   self['.style_set'][style] = true
219   self['.colored_set'][colored] = true
220 end
221 local function cache_clean_unused(self)
222   local to_remove = {}
223   for f in lfs.dir(dir_p) do
224     if not self['.style_set'][f] and not self['.colored_set'][f] then
225       to_remove[f] = true
226     end
227   end
228   for k,_ in pairs(to_remove) do
229     os.remove(dir_p .. k)
230   end
231 end

```

`_DESCRIPTION` Short text description of the module.

```
232 local _DESCRIPTION = [[Global coder utilities on the lua side]]  
  
    (End definition for _DESCRIPTION. This variable is documented on page ??.)
```

`already` false at the beginning, true after the first call of `coder-tool.py`

```

256  already             = false,

257  }

258  %</lua>

```

File II

coder-tool.py implementation

The standard header is managed specially because of the way `docstrip` automatically adds some header when extracting stuff from an archive. The next two lines are added by `docstrip` at the top of the preamble.

```

1  %<*py>
2  #! /usr/bin/env python3
3  # -*- coding: utf-8 -*-
4  %</py>

```

1 Usage

Run: `coder-tool.py -h`.

2 Header and global declarations

```
5 %<*py>
6 __version__ = '0.10'
7 __YEAR__ = '2022'
8 __docformat__ = 'restructuredtext'
9
10 from posixpath import split
11 import sys

13 import re
14 from pathlib import Path
15 import hashlib
16 import json
17 from pygments import highlight as hilight
18 from pygments.formatters.latex import LatexEmbeddedLexer, LatexFormatter
19 from pygments.lexers import get_lexer_by_name
20 from pygments.util import ClassNotFound
21 from pygments.util import guess_decode
```

3 Options classes

Object is used to turn a dictionary into a full fledged object. The real class is given by the `__cls__` key.

```
22 class Options(object):
23     @staticmethod
24     def ensure_bool(x):
25         if x == True or x == False: return x
26         x = x[0:1]
27         return x == 'T' or x == 't'
28
29     def __new__(cls, d={}, *args, **kwargs):
30         __cls__ = d.get('__cls__', 'arguments')
31         if __cls__ == 'PygOpts':
32             return super(Controller.Options, cls).__new__(
33                 Controller.PygOpts, *args, **kwargs
34             )
35         elif __cls__ == 'FVOpts':
36             return super(Controller.Options, cls).__new__(
37                 Controller.FVOpts, *args, **kwargs
38             )
39         elif __cls__ == 'TeXOpts':
40             return super(Controller.Options, cls).__new__(
41                 Controller.TeXOpts, *args, **kwargs
42             )
43         else:
44             return super(Controller.Options, cls).__new__(
45                 Controller.Arguments, *args, **kwargs
46             )
47     def __init__(self, d={}):
48         for k, v in d.items():
49             if type(v) == str:
```

```

49         if v.lower() == 'true':
50             setattr(self, k, True)
51             continue
52         elif v.lower() == 'false':
53             setattr(self, k, False)
54             continue
55         setattr(self, k, v)
56     def __repr__(self):
57         return f"{object['__repr__'](self)}: {self['__dict__']}"

```

3.1 TeXOpts nested class

```

58 class TeXOpts(Options):
59     tags = ''
60     inline = True
61     already_style = False

```

The templates are provided by `coder.sty`. The style template wraps the style definitions provided by `pygments`. It may include the style name

```

62     sty_template='<placeholder:style_defs>'
63     code_template = '<placeholder:hilighted>'
64     single_line_template='<placeholder:number><placeholder:line>'
65     first_line_template='<placeholder:number><placeholder:line>'
66     second_line_template='<placeholder:number><placeholder:line>'
67     white_line_template='<placeholder:number><placeholder:line>'
68     black_line_template='<placeholder:number><placeholder:line>'
69     block_template='<placeholder:count><placeholder:hilighted>'
70     def __init__(self, *args, **kwargs):
71         super().__init__(*args, **kwargs)
72         self.inline = self.ensure_bool(self.inline)

```

3.2 PygOpts nested class

`pygments LaTeXFormatter` options. Some of them may be deliberately unused. In particular, line numbering is governed by `fancyvrb` options. The description of these options is in a forthcoming section.

```

73 class PygOpts(Options):
74     style = 'default'
75     nobackground = False
76     linenos = False
77     linenostart = 1
78     linenostep = 1
79     commandprefix = 'Py'
80     texcomments = False
81     mathescape = False
82     escapeinside = ""
83     envname = 'Verbatim'
84     lang = 'tex'
85     def __init__(self, *args, **kwargs):
86         super().__init__(*args, **kwargs)
87         self.linenos = Controller.ensure_bool(self.linenos)
88         self.linenostart = abs(int(self.linenostart))

```

```

89     self.linenostep = abs(int(self.linenostep))
90     self.texcomments = Controller.ensure_bool(self.texcomments)
91     self.mathescape = Controller.ensure_bool(self.mathescape)

```

3.3 FV nested class

```

92 class FVOpts(Options):
93     gobble = 0
94     tabsize = 4
95     linenosep = 'Opt'
96     commentchar = ''
97     frame = 'none'
98     label = ''
99     labelposition = 'none'
100    numbers = 'left'
101    numbersep = r'\hspace{1ex}'
102    firstnumber = 'auto'
103    stepnumber = 1
104    numberblanklines = True
105    firstline = ''
106    lastline = ''
107    baselinestretch = 'auto'
108    resetmargins = True
109    xleftmargin = 'Opt'
110    xrightmargin = 'Opt'
111    hfuzz = '2pt'
112    samepage = False
113    def __init__(self, *args, **kwargs):
114        super().__init__(*args, **kwargs)
115        self.gobble = abs(int(self.gobble))
116        self.tabsize = abs(int(self.tabsize))
117        if self.firstnumber != 'auto':
118            self.firstnumber = abs(int(self.firstnumber))
119        self.stepnumber = abs(int(self.stepnumber))
120        self.linenostep = abs(int(self.linenostep))
121        self.numberblanklines = Controller.ensure_bool(self.numberblanklines)
122        self.resetmargins = Controller.ensure_bool(self.resetmargins)
123        self.samepage = Controller.ensure_bool(self.samepage)

```

3.4 Arguments nested class

```

124 class Arguments(Options):
125     cache = False
126     debug = False
127     code = ""
128     json = ""
129     directory = "."
130     texopts = TeXOpts()
131     pygopts = PygOpts()

198     return parser
199

```

4.2 Static methods

<code>Controller.lua_command</code>	<code>self.lua_command(<(asynchronous lua command)>)</code>
<code>Controller.lua_command_now</code>	<code>self.lua_command_now(<(synchronous lua command)>)</code>

Wraps the given command between markers. It will be in the output of the `coder-tool.py`, further captured by `coder-util.lua` and either forwarded to `TEX` or executed synchronously.

```

200 @staticmethod
201 def lua_command(cmd):
202     print(f'<<<<?LUA:{cmd}>>>>')
203 @staticmethod
204 def lua_command_now(cmd):
205     print(f'<<<<!LUA:{cmd}>>>>')

```

4.3 Methods

4.3.1 `--init--`

`--init--` Constructor. Reads the command line arguments.

```
206 def __init__(self, argv = sys.argv):
207     argv = argv[1:] if re.match(".*coder\-\tool\.py$", argv[0]) else argv
208     ns = self.parser.parse_args(
209         argv if len(argv) else ['-h']
210     )
211     with open(ns.json, 'r') as f:
212         self.arguments = json.load(
213             f,
214             object_hook=Controller.Object
215         )
216     texopts = self.texopts = self.arguments.texopts
217     pygopts = self.pygopts = self.arguments.pygopts
218     fv_opts = self.fv_opts = self.arguments.fv_opts
219     formatter = self.formatter = LatexFormatter(
220         style=pygopts.style,
221         nobackground = pygopts.nobackground,
222         commandprefix = pygopts.commandprefix,
223         texcomments = pygopts.texcomments,
224         mathescape = pygopts.mathescape,
225         escapeinside = pygopts.escapeinside,
226         envname = u'CDR@Pyg@Verbatim',
227     )
228
229     try:
230         lexer = self.lexer = get_lexer_by_name(self.arguments.lang)
231     except ClassNotFound as err:
232         sys.stderr.write('Error: ')
233         sys.stderr.write(str(err))
234
235     escapeinside = pygopts.escapeinside
236     # When using the LaTeX formatter and the option 'escapeinside' is
237     # specified, we need a special lexer which collects escaped text
238     # before running the chosen language lexer.
239     if len(escapeinside) == 2:
240         left = escapeinside[0]
241         right = escapeinside[1]
242         lexer = self.lexer = LatexEmbeddedLexer(left, right, lexer)
243
244     gobble = fv_opts.gobble
245     if gobble:
246         lexer.add_filter('gobble', n=gobble)
247     tabsize = fv_opts.tabsize
248     if tabsize:
249         lexer.tabsize = tabsize
250     lexer.encoding = ''
251
```

4.3.2 get_pyg_tex_p

get_pyg_tex_p $\langle \text{variable} \rangle$ = self.get_pyg_tex_p($\langle \text{digest string} \rangle$)

The full path of the file where the colored commands created by `pygments` are stored. The digest allows to uniquely identify the code initially colored such that caching is easier.

```
252 def get_pyg_tex_p(self, digest):
253     return (self.pygd_p / digest).with_suffix(".pyg.tex")
```

4.3.3 create_style

self.create_style self.create_style()

Where the $\langle \text{style} \rangle$ is created. Does quite nothing if the style is already available.

```
254 def create_style(self):
255     pyg_sty_p = self.pyg_sty_p
256     if self.arguments.cache and pyg_sty_p.exists():
257         print("Already available:", pyg_sty_p)
258         return
259     texopts = self.texopts
260     if texopts.already_style:
261         return
262     formatter = self.formatter
263     style_defs = formatter.get_style_defs() \
264         .replace(r'\makeatletter', '') \
265         .replace(r'\makeatother', '') \
266         .replace('\n', '%\n')
267     sty = self.texopts.sty_template.replace(
268         '<placeholder:style_defs>',
269         style_defs,
270     )
271     with pyg_sty_p.open(mode='w', encoding='utf-8') as f:
272         f.write(sty)
```

4.3.4 pygmentize

self.pygmentize $\langle \text{code variable} \rangle$ = self.pygmentize($\langle \text{code} \rangle$ [, inline= $\langle \text{yorn} \rangle$])

Where the $\langle \text{code} \rangle$ is highlighted by `pygments`.

```
273 def pygmentize(self, code):
274     code = highlight(code, self.lexer, self.formatter)
275     m = re.match(
276         r'\begin{CDR@Pyg@Verbatim}.*?\n(.*)\n\end{CDR@Pyg@Verbatim}\s*\Z',
277         code,
278         flags=re.S
279     )

3 Constants

`\c_CDR_tag` Paths of L3keys modules.
`\c_CDR_Tags` These are root path components used throughout the package.

```
21 \str_const:Nn \c_CDR_Tags { CDR@Tags }
22 \str_const:Nx \c_CDR_tag { \c_CDR_Tags/tag }
```

(End definition for \c_CDR_tag and \c_CDR_Tags. These variables are documented on page ??.)

`\c_CDR_tag_get` Root identifier for tag properties, used throughout the package.
`\c_CDR_slash`

```
23 \str_const:Nn \c_CDR_tag_get { CDR@tag@get }
24 \str_const:Nx \c_CDR_slash { \tl_to_str:n {/} }
```

(End definition for \c_CDR_tag_get and \c_CDR_slash. These variables are documented on page ??.)

4 Implementation details

As far as possible, macro making assignments to variables are protected. All variables following `expl3` naming conventions are implementation details and therefore must be considered private.

5 Variables

5.1 Internal scratch variables

These local variables are used in a very limited scope.

`\l_CDR_bool` Local scratch variable.

25 `\bool_new:N \l_CDR_bool`

(End definition for \l_CDR_bool. This variable is documented on page ??.)

`\l_CDR_tl` Local scratch variable.

26 `\tl_new:N \l_CDR_tl`

(End definition for \l_CDR_tl. This variable is documented on page ??.)

`\l_CDR_str` Local scratch variable.

27 `\str_new:N \l_CDR_str`

(End definition for \l_CDR_str. This variable is documented on page ??.)

`\l_CDR_seq` Local scratch variable.

28 `\seq_new:N \l_CDR_seq`

(End definition for \l_CDR_seq. This variable is documented on page ??.)

`\l_CDR_prop` Local scratch variable.

29 `\prop_new:N \l_CDR_prop`

(End definition for \l_CDR_prop. This variable is documented on page ??.)

`\l_CDR_clist` The comma separated list of current chunks.

30 `\clist_new:N \l_CDR_clist`

(End definition for \l_CDR_clist. This variable is documented on page ??.)

5.2 Files

`\l_CDR_in` Input file identifier

31 `\ior_new:N \l_CDR_in`

(End definition for \l_CDR_in. This variable is documented on page ??.)

`\l_CDR_out` Output file identifier

32 `\iow_new:N \l_CDR_out`

(End definition for \l_CDR_out. This variable is documented on page ??.)

5.3 Global variables

Line number counter for the code chunks.

`\g_CDR_code_int` Chunk number counter.

33 `\int_new:N \g_CDR_code_int`

(End definition for `\g_CDR_code_int`. This variable is documented on page ??.)

`\g_CDR_code_prop` Global code property list.

34 `\prop_new:N \g_CDR_code_prop`

(End definition for `\g_CDR_code_prop`. This variable is documented on page ??.)

`\g_CDR_chunks_tl` The comma separated list of current chunks. If the next list of chunks is the same as the
`\l_CDR_chunks_tl` current one, then it might not display.

35 `\tl_new:N \g_CDR_chunks_tl`

36 `\tl_new:N \l_CDR_chunks_tl`

(End definition for `\g_CDR_chunks_tl` and `\l_CDR_chunks_tl`. These variables are documented on page ??.)

`\g_CDR_vars` Tree storage for global variables.

37 `\prop_new:N \g_CDR_vars`

(End definition for `\g_CDR_vars`. This variable is documented on page ??.)

`\g_CDR_hook_tl` Hook general purpose.

38 `\tl_new:N \g_CDR_hook_tl`

(End definition for `\g_CDR_hook_tl`. This variable is documented on page ??.)

`\g/CDR/Chunks/<name>` List of chunk keys for given named code.

(End definition for `\g/CDR/Chunks/<name>`. This variable is documented on page ??.)

5.4 Local variables

`\l_CDR_keyval_tl` keyval storage.

39 `\tl_new:N \l_CDR_keyval_tl`

(End definition for `\l_CDR_keyval_tl`. This variable is documented on page ??.)

`\l_CDR_options_tl` options storage.

40 `\tl_new:N \l_CDR_options_tl`

(End definition for `\l_CDR_options_tl`. This variable is documented on page ??.)

`\l_CDR_recorded_tl` Full verbatim body of the CDR environment.

41 `\tl_new:N \l_CDR_recorded_tl`

(End definition for `\l_CDR_recorded_tl`. This variable is documented on page ??.)

`\g_CDR_int` Global integer to store linenos locally in time.

42 `\int_new:N \g_CDR_int`

(End definition for `\g_CDR_int`. This variable is documented on page ??.)

`\l_CDR_line_tl` Token list for one line.

43 `\tl_new:N \l_CDR_line_tl`

(End definition for `\l_CDR_line_tl`. This variable is documented on page ??.)

`\l_CDR_lineno_tl` Token list for lineno display.

44 `\tl_new:N \l_CDR_lineno_tl`

(End definition for `\l_CDR_lineno_tl`. This variable is documented on page ??.)

`\l_CDR_name_tl` Token list for chunk name display.

45 `\tl_new:N \l_CDR_name_tl`

(End definition for `\l_CDR_name_tl`. This variable is documented on page ??.)

`\l_CDR_info_tl` Token list for the info of line.

46 `\tl_new:N \l_CDR_info_tl`

(End definition for `\l_CDR_info_tl`. This variable is documented on page ??.)

6 Tag properties

The tag properties concern the code chunks. They are set from different path, such that `\l_keys_path_str` must be properly parsed for that purpose. Commands in this section and the next ones contain `CDR_tag`.

The `<tag names>` starting with a double underscore are reserved by the package.

6.1 Helpers

`\g_CDR_tag_path_seq` Global variable to store relative key path. Used for automatic management to know what has been defined explicitly.

47 `\seq_new:N \g_CDR_tag_path_seq`

(End definition for `\g_CDR_tag_path_seq`. This variable is documented on page ??.)

`\CDR_tag_get_path:cc` ★ `\CDR_tag_get_path:cc {<tag name>} {<relative key path>}`

Internal: return a unique key based on the arguments. Used to store and retrieve values.

48 `\cs_new:Npn \CDR_tag_get_path:cc #1 #2 {`

49 `\c_CDR_tag_get @ #1 / #2 :`

50 `}`

6.2 Set

<code>\CDR_tag_set:ccn</code> <code>\CDR_tag_set:ccV</code>	<code>\CDR_tag_set:ccn {⟨tag name⟩} {⟨relative key path⟩} {⟨value⟩}</code> Store $\langle value \rangle$, which is further retrieved with the instruction <code>\CDR_tag_get:cc {⟨tag name⟩} {⟨relative key path⟩}</code> . Only $\langle tag name \rangle$ and $\langle relative key path \rangle$ containing no @ character are supported. Record the relative key path (the part after the tag name) of the current full key path in <code>g_CDR_tag_path_seq</code> . All the affectations are made at the current $\text{T}_{\text{E}}\text{X}$ group level. <i>Nota Bene:</i> <code>\cs_generate_variant:Nn</code> is buggy when there is a ‘c’ argument.
--	---

```

51 \cs_new_protected:Npn \CDR_tag_set:ccn #1 #2 #3 {
52   \seq_put_left:Nx \g_CDR_tag_path_seq { #2 }
53   \cs_set:cpn { \CDR_tag_get_path:cc { #1 } { #2 } } { \exp_not:n { #3 } }
54 }
55 \cs_new_protected:Npn \CDR_tag_set:ccV #1 #2 #3 {
56   \exp_args:NnnV
57   \CDR_tag_set:ccn { #1 } { #2 } #3
58 }

```

`\c_CDR_tag_regex` To parse a l3keys full key path.

```

59 \tl_set:Nn \l_CDR_tl { /([~/*])/(.*)$ } \use_none:n { $ }
60 \tl_put_left:NV \l_CDR_tl \c_CDR_tag
61 \tl_put_left:Nn \l_CDR_tl { ^ }
62 \exp_args:NNV
63 \regex_const:Nn \c_CDR_tag_regex \l_CDR_tl

```

(End definition for `\c_CDR_tag_regex`. This variable is documented on page ??.)

<code>\CDR_tag_set:n</code>	<code>\CDR_tag_set:n {⟨value⟩}</code>
-----------------------------	---------------------------------------

The value is provided but not the $\langle dir \rangle$ nor the $\langle relative key path \rangle$, both are guessed from `\l_keys_path_str`. More precisely, `\l_keys_path_str` is expected to read something like `\c_CDR_tag/⟨tag name⟩/⟨relative key path⟩`, an exception is raised on the contrary. This is meant to be call from `\keys_define:nn` argument. Implementation detail: the last argument is parsed by the last command.

```

64 \cs_new:Npn \CDR_tag_set:n {
65   \exp_args:NnV
66   \regex_extract_once:NnNTF \c_CDR_tag_regex
67     \l_keys_path_str \l_CDR_seq {
68     \CDR_tag_set:ccn
69     { \seq_item:Nn \l_CDR_seq 2 }
70     { \seq_item:Nn \l_CDR_seq 3 }
71   } {
72     \PackageWarning
73     { coder }
74     { Unexpected-key~path~‘\l_keys_path_str’ }
75     \use_none:n
76   }
77 }

```

`\CDR_tag_set:` `\CDR_tag_set:`

None of `<dir>`, `<relative key path>` and `<value>` are provided. The latter is guessed from `\l_keys_value_tl`, and `CDR_tag_set:n` is called. This is meant to be call from `\keys_define:nn` argument.

```
78 \cs_new:Npn \CDR_tag_set: {  
79   \exp_args:NV  
80   \CDR_tag_set:n \l_keys_value_tl  
81 }
```

`\CDR_tag_set:cn` `\CDR_tag_set:cn {{key path}} {{value}}`

When the last component of `\l_keys_path_str` should not be used to store the `<value>`, but `<key path>` should be used instead. This last component is replaced and `\CDR_tag_set:n` is called afterwards. Implementation detail: the second argument is parsed by the last command of the expansion.

```
82 \cs_new:Npn \CDR_tag_set:cn #1 {  
83   \exp_args:NnV  
84   \regex_extract_once:NnNTF \c_CDR_tag_regex  
85     \l_keys_path_str \l_CDR_seq {  
86     \CDR_tag_set:cn  
87     { \seq_item:Nn \l_CDR_seq 2 }  
88     { #1 }  
89   } {  
90     \PackageWarning  
91       { coder }  
92       { Unexpected~key~path~'\l_keys_path_str' }  
93     \use_none:n  
94   }  
95 }
```

`\CDR_tag_choices:` `\CDR_tag_choices:`

Ensure that the `\l_keys_path_str` is set properly. This is where a syntax like `\keys_set:nn {...} { choice/a }` is managed.

```
96 \regex_const:Nn \c_CDR_root_regex { ^(.*)/.*$ } \use_none:n { $ }  
97 \cs_new:Npn \CDR_tag_choices: {  
98   \exp_args:NVV  
99   \str_if_eq:nnT \l_keys_key_tl \l_keys_choice_tl {  
100     \exp_args:NnV  
101     \regex_extract_once:NnNT \c_CDR_root_regex  
102       \l_keys_path_str \l_CDR_seq {  
103       \str_set:Nx \l_keys_path_str {  
104         \seq_item:Nn \l_CDR_seq 2  
105       }  
106     }  
107   }  
108 }
```

`\CDR_tag_choices_set:` `\CDR_tag_choices_set:`

Calls `\CDR_tag_set:n` with the content of `\l_keys_choice_tl` as value. Before, ensure that the `\l_keys_path_str` is set properly.

```

109 \cs_new:Npn \CDR_tag_choices_set: {
110   \CDR_tag_choices:
111   \exp_args:NV
112   \CDR_tag_set:n \l_keys_choice_tl
113 }

```

`\CDR_if_truthy:nTF` `\CDR_if_truthy:nTF {<token list>} {<true code>} {<false code>}`

`\CDR_if_truthy:eTF` Execute `<true code>` when `<token list>` is a truthy value, `<false code>` otherwise. A truthy value is a text which leading character, if any, is none of “fFnN”.

```

114 \prg_new_conditional:Nnn \CDR_if_truthy:n { p, T, F, TF } {
115   \str_compare:nNnTF { \str_lowercase:n { #1 } } = { false } {
116     \prg_return_false:
117   } {
118     \prg_return_true:
119   }
120 }
121 \prg_generate_conditional_variant:Nnn \CDR_if_truthy:n { e } { p, T, F, TF }

```

`\CDR_tag_boolean_set:n` `\CDR_tag_boolean_set:n {<choice>}`

Calls `\CDR_tag_set:n` with `true` if the argument is truthy, `false` otherwise.

```

122 \cs_new:Npn \CDR_tag_boolean_set:n #1 {
123   \CDR_if_truthy:nTF { #1 } {
124     \CDR_tag_set:n { true }
125   } {
126     \CDR_tag_set:n { false }
127   }
128 }
129 \cs_generate_variant:Nn \CDR_tag_boolean_set:n { x }

```

6.3 Retrieving tag properties

Internally, all tag properties are collected with a full key path like `\c_CDR_tag_get/<tag name>/<relative key path>`. When typesetting some code with either the `\CDRCode` command or the `CDRBlock` environment, all properties defined locally are collected under the reserved `\c_CDR_tag_get/__local/<relative path>` full key paths. The `l3keys` module `\c_CDR_tag_get/__local` is modified in \TeX groups only. For running text code chunks, this module inherits from

1. `\c_CDR_tag_get/<tag name>` for the provided `<tag name>`,
2. `\c_CDR_tag_get/default.code`
3. `\c_CDR_tag_get/default`
4. `\c_CDR_tag_get/__pygments`

5. \c_CDR_tag_get/___fancyvrb
6. \c_CDR_tag_get/___fancyvrb.all when no using pygments

For text block code chunks, this module inherits from

1. \c_CDR_tag_get/⟨name₁⟩, ..., \c_CDR_tag_get/⟨name_n⟩ for each tag name of the ordered tags list
2. \c_CDR_tag_get/default.block
3. \c_CDR_tag_get/default
4. \c_CDR_tag_get/___pygments
5. \c_CDR_tag_get/___pygments.block
6. \c_CDR_tag_get/___fancyvrb
7. \c_CDR_tag_get/___fancyvrb.block
8. \c_CDR_tag_get/___fancyvrb.all when no using pygments

```
\CDR_tag_if_exist_here:ccTF * \CDR_tag_if_exist_here:ccTF {⟨tag name⟩} ⟨relative key path⟩ {⟨true code⟩} {⟨false code⟩}
```

If the ⟨relative key path⟩ is known within ⟨tag name⟩, the ⟨true code⟩ is executed, otherwise, the ⟨false code⟩ is executed. No inheritance.

```
130 \prg_new_conditional:Nnn \CDR_tag_if_exist_here:cc { T, F, TF } {
131   \cs_if_exist:cTF { \CDR_tag_get_path:cc { #1 } { #2 } } {
132     \prg_return_true:
133   } {
134     \prg_return_false:
135   }
136 }
```

```
\CDR_tag_if_exist:ccTF * \CDR_tag_if_exist:ccTF {⟨tag name⟩} ⟨relative key path⟩ {⟨true code⟩} {⟨false code⟩}
```

If the ⟨relative key path⟩ is known within ⟨tag name⟩, the ⟨true code⟩ is executed, otherwise, the ⟨false code⟩ is executed if none of the parents has the ⟨relative key path⟩ on its own.

```
137 \prg_new_conditional:Nnn \CDR_tag_if_exist:cc { T, F, TF } {
138   \cs_if_exist:cTF { \CDR_tag_get_path:cc { #1 } { #2 } } {
139     \prg_return_true:
140   } {
141     \seq_if_exist:cTF { \CDR_tag_parent_seq:c { #1 } } {
142       \seq_map_tokens:cn
143         { \CDR_tag_parent_seq:c { #1 } }
144         { \CDR_tag_if_exist_f:cn { #2 } }
145     } {
146       \prg_return_false:
147     }
148 }
```

```

148 }
149 }
150 \cs_new:Npn \CDR_tag_if_exist_f:cn #1 #2 {
151   \quark_if_no_value:nTF { #2 } {
152     \seq_map_break:n {
153       \prg_return_false:
154     }
155   } {
156     \CDR_tag_if_exist:ccT { #2 } { #1 } {
157       \seq_map_break:n {
158         \prg_return_true:
159       }
160     }
161   }
162 }

```

\CDR_tag_get:cc * \CDR_tag_get:cc {<tag name>} {<relative key path>}

The property value stored for <tag name> and <relative key path>. Takes care of inheritance.

```

163 \cs_new:Npn \CDR_tag_get:cc #1 #2 {
164   \CDR_tag_if_exist_here:ccTF { #1 } { #2 } {
165     \use:c { \CDR_tag_get_path:cc { #1 } { #2 } }
166   } {
167     \seq_if_exist:cT { \CDR_tag_parent_seq:c { #1 } } {
168       \seq_map_tokens:cn
169       { \CDR_tag_parent_seq:c { #1 } }
170       { \CDR_tag_get_f:cn { #2 } }
171     }
172   }
173 }
174 \cs_new:Npn \CDR_tag_get_f:cn #1 #2 {
175   \quark_if_no_value:nF { #2 } {
176     \CDR_tag_if_exist_here:ccT { #2 } { #1 } {
177       \seq_map_break:n {
178         \use:c { \CDR_tag_get_path:cc { #2 } { #1 } }
179       }
180     }
181   }
182 }

```

\CDR_tag_get:c * \CDR_tag_get:n {<relative key path>}

The property value stored for the `__local` <tag name> and <relative key path>. Takes care of inheritance. Implementation detail: the parameter is parsed by the last command of the expansion.

```

183 \cs_new:Npn \CDR_tag_get:c {
184   \CDR_tag_get:cc { __local }
185 }

```

\CDR_tag_get:cN \CDR_tag_get:cN {<relative key path>} {<tl variable>}

Put in <tl variable> the property value stored for the __local <tag name> and <relative key path>.

```
186 \cs_new:Npn \CDR_tag_get:cN #1 #2 {
187   \tl_set:Nx #2 { \CDR_tag_get:c { #1 } }
188 }
```

\CDR_tag_get:ccNTF \CDR_tag_get:ccNTF {<tag name>} {<relative key path>} <tl var> {<true code>} {<false code>}

Getter with branching. If the <relative key path> is known, save the value into <tl var> and execute <true code>. Otherwise, execute <false code>.

```
189 \prg_new_conditional:Nnn \CDR_tag_get:ccN { T, F, TF } {
190   \CDR_tag_if_exist:nnTF { #1 } { #2 } {
191     \tl_set:Nx #3 \CDR_tag_get:cc { #1 } { #2 }
192     \prg_return_true:
193   } {
194     \prg_return_false:
195   }
196 }
```

6.4 Inheritance

When a child inherits from a parent, all the keys of the parent that are not inherited are made available to the child (inheritance does not jump over generations).

\CDR_tag_parent_seq:c ★ \CDR_tag_parent_seq:c {<tag name>}

Return the name of the sequence variable containing the list of the parents. Each child has its own sequence of parents.

```
197 \cs_new:Npn \CDR_tag_parent_seq:c #1 {
198   g_CDR:parent.tag @ #1 _seq
199 }
```

\CDR_tag_inherit:cn \CDR_tag_inherit:cn {<child name>} {<parent names comma list>}

Set the parents of <child name> to the given list.

```
200 \cs_new:Npn \CDR_tag_inherit:cn #1 #2 {
201   \seq_set_from_clist:cn { \CDR_tag_parent_seq:c { #1 } } { #2 }
202   \seq_remove_duplicates:c \l_CDR_tl
203   \seq_remove_all:cn \l_CDR_tl {}
204   \seq_put_right:cn \l_CDR_tl { \q_no_value }
205 }
206 \cs_new:Npn \CDR_tag_inherit:cx {
207   \exp_args:Nnx \CDR_tag_inherit:cn
208 }
209 \cs_new:Npn \CDR_tag_inherit:cV {
210   \exp_args:NnV \CDR_tag_inherit:cn
211 }
```

7 Cache management

If there is no `<jobname>.aux` file, there should be no cached files either, `coder-util.lua` is asked to clean all of them, if any.

```
212 \AddToHook { begindocument/before } {
213   \IfFileExists {./\jobname.aux} {} {
214     \lua_now:n {CDR:cache_clean_all()}
215   }
216 }
```

At the end of the document, `coder-util.lua` is asked to clean all unused cached files that could come from a previous process.

```
217 \AddToHook { enddocument/end } {
218   \lua_now:n {CDR:cache_clean_unused()}
219 }
```

8 Utilities

<code>\CDR_clist_map_inline:Nnn</code>	<code>\CDR_clist_map_inline:Nnn <clist var> {<empty code>} {<non empty code>}</code> Execute <code><empty code></code> when the list is empty, otherwise call <code>\clist_map_inline:Nn</code> with <code><non empty code></code> .
--	---

```
220 \cs_new:Npn \CDR_clist_map_inline:Nnn #1 #2 {
221   \clist_if_empty:NTF #1 {
222     #2
223     \use_none:n
224   } {
225     \clist_map_inline:Nn #1
226   }
227 }
```

<code>\CDR_if_block_p: *</code>	<code>\CDR_if_block:TF {<true code>} {<false code>}</code>
<code>\CDR_if_block:TF *</code>	Execute <code><true code></code> when inside a code block, <code><false code></code> when inside an inline code. Raises an error otherwise.

```
228 \prg_new_conditional:Nnn \CDR_if_block: { p, T, F, TF } {
229   \PackageError
230     { coder }
231     { Conditional-not-available }
232 }
```

<code>\CDR_process_record:</code>	Record the current line or not. The default implementation does nothing and is meant to be defines locally.
-----------------------------------	---

```
233 \cs_new:Npn \CDR_process_record: {}
```

9 13keys modules for code chunks

All these modules are initialized at the beginning of the document using the `__initialize` meta key.

9.1 Utilities

```
\CDR_tag_keys_define:nn \CDR_tag_keys_define:nn {< module base >} {< keyval list >}
```

The `<module>` is uniquely based on `<module base>` before forwarding to `\keys_define:nn`.

```
234 \cs_generate_variant:Nn \keys_define:nn { Vn, xn }
235 \cs_new:Npn \CDR_tag_keys_define:nn #1 {
236   \keys_define:xn { \c_CDR_tag / \exp_not:n { #1 } }
237 }
238 \cs_generate_variant:Nn \CDR_tag_keys_define:nn { nx }
```

```
\CDR_tag_keys_set:nn \CDR_tag_keys_set:nn {<module base>} {<keyval list>}
```

The `<module>` is uniquely based on `<module base>` before forwarding to `\keys_set:nn`.

```
239 \cs_new:Npn \CDR_tag_keys_set:nn #1 {
240   \exp_args:Nx
241   \keys_set:nn { \c_CDR_tag / \exp_not:n { #1 } }
242 }
```

9.1.1 Handling unknown tags

While using `\keys_set:nn` and variants, each time a full key path matching the pattern `\c_CDR_tag/<tag name>/<relative key path>` is not recognized, we assume that the client implicitly wants a tag with the given `<tag name>` to be defined. For that purpose, we collect unknown keys with `\keys_set_known:nnnN` then process them to find each `<tag name>` and define the new tag accordingly. A similar situation occurs for display engine options where the full key path reads `\c_CDR_tag/<tag name>/<engine name>` engine options where `<engine name>` is not known in advance.

```
\CDR_keys_set_known:nnN \CDR_keys_set_known:nnN {<module>} {<key[=value] items>} <tl var>
```

Wrappers over `\keys_set_known:nnnN` where the `<root>` is also the `<module>`.

```
243 \cs_new:Npn \CDR_keys_set_known:nnN #1 #2 {
244   \keys_set_known:nnnN { #1 } { #2 } { #1 }
245 }
246 \cs_generate_variant:Nn \CDR_keys_set_known:nnN { x, VV }
```

```
\CDR_tag_keys_set_known:nnN \CDR_tag_keys_set_known:nnN {<tag name>} {<key[=value] items>} <tl var>
```

Wrappers over `\keys_set_known:nnnN` where the module is given by `\c_CDR_tag/<tag name>`. *Implementation detail* the remaining arguments are absorbed by the last macro.

```

247 \cs_generate_variant:Nn \keys_set_known:nnnN { VVV, nVx }
248 \cs_new:Npn \CDR_tag_keys_set_known:nnN #1 {
249   \CDR_keys_set_known:xnN { \c_CDR_tag / \exp_not:n { #1 } }
250 }
251 \cs_generate_variant:Nn \CDR_tag_keys_set_known:nnN { nV }

```

`\c_CDR_provide_regex` To parse a l3keys full key path.

```

252 \tl_set:Nn \l_CDR_tl { /([~/]*)?(?:/(.))*? $ } \use_none:n { $ }
253 \tl_put_left:NV \l_CDR_tl \c_CDR_tag
254 \tl_put_left:Nn \l_CDR_tl { ^ }
255 \exp_args:NNV
256 \regex_const:Nn \c_CDR_provide_regex \l_CDR_tl

```

(End definition for \c_CDR_provide_regex. This variable is documented on page ??.)

```

\CDR_tag_provide_from_clist:n   \CDR_tag_provide_from_clist:n {<deep comma list>}
\CDR_tag_provide_from_keyval:n \CDR_tag_provide_from_keyval:n {<key-value list>}

```

`<deep comma list>` has format `tag/<tag name comma list>`. Parse the `<key-value list>` for full key path matching `tag/<tag name>/<relative key path>`, then ensure that `\c_CDR_tag/<tag name>` is a known full key path. For that purpose, we use `\keyval_parse:nnn` with two `\CDR_tag_provide:` helper.

Notice that a tag name should contain no `'/'`.

```

257 \regex_const:Nn \c_CDR_engine_regex { ^([~/]*)*\sengine\soptions$ } \use_none:n { $ }
258 \cs_new:Npn \CDR_tag_provide_from_clist:n #1 {
259   \exp_args:NNx
260   \regex_extract_once:NnNTF \c_CDR_provide_regex {

309     }
310 }
311 \cs_generate_variant:Nn \CDR_tag_provide_from_keyval:n { V }

```

9.2 pygments

These are `pygments`'s `LatexFormatter` options, that are not covered by `__fancyvrb`. They are made available at the end user level, but may not be relevant when `pygments` is not used.

9.2.1 Utilities

<code>\CDR_has_pygments_p: *</code> <code>\CDR_has_pygments:<u>TF</u> *</code>	<code>\CDR_has_pygments:TF {⟨true code⟩} {⟨false code⟩}</code> Execute <code>⟨true code⟩</code> when <code>pygments</code> is available, <code>⟨false code⟩</code> otherwise. <i>Implementation detail:</i> we define the conditionals and set them afterwards.
---	--

```

312 \sys_get_shell:nnN {which-pygmentize} {} \l_CDR_tl
313 \prg_new_conditional:Nnn \CDR_has_pygments: { p, T, F, TF } { }
314 \tl_if_in:NnTF \l_CDR_tl { pygmentize } {
315     \prg_set_conditional:Nnn \CDR_has_pygments: { p, T, F, TF } {
316         \prg_return_true:
317     }
318 } {
319     \prg_set_conditional:Nnn \CDR_has_pygments: { p, T, F, TF } {
320         \prg_return_false:
321     }
322 }

```

9.2.2 `--pygment` `l3keys` module

```

323 \CDR_tag_keys_define:nn { __pygments } {
  ● lang=<language name> where <language name> is recognized by pygments, including a
    void string,

324   lang .code:n = \CDR_tag_set:,
325   lang .value_required:n = true,

  ● pygments[=true|false] whether pygments should be used for syntax coloring. Initially
    true if pygments is available, false otherwise.

326   pygments .code:n = \CDR_tag_boolean_set:x { #1 },

  ● style=<style name> where <style name> is recognized by pygments, including a void
    string,

327   style .code:n = \CDR_tag_set:,
328   style .value_required:n = true,

  ● commandprefix=<text> The  $\text{\LaTeX}$  commands used to produce colored output are con-
    structed using this prefix and some letters. Initially PY.

329   commandprefix .code:n = \CDR_tag_set:,
330   commandprefix .value_required:n = true,

  ● mathescape[=true|false] If set to true, enables  $\text{\LaTeX}$  math mode escape in comments.
    That is, $...$ inside a comment will trigger math mode. Initially false.

331   mathescape .code:n = \CDR_tag_boolean_set:x { #1 },
332   mathescape .default:n = true,

  ● escapeinside=<before><after> If set to a string of length 2, enables escaping to  $\text{\LaTeX}$ .
    Text delimited by these 2 characters is read as  $\text{\LaTeX}$  code and typeset accordingly.
    It has no effect in string literals. It has no effect in comments if texcomments or
    mathescape is set. Initially empty.

333   escapeinside .code:n = \CDR_tag_set:,
334   escapeinside .value_required:n = true,

  ● --initialize Initializer.

335   __initialize .meta:n = {
336     lang = tex,
337     pygments = \CDR_has_pygments:TF { true } { false },
338     style=default,
339     commandprefix=PY,
340     mathescape=false,
341     escapeinside=,
342   },
343   __initialize .value_forbidden:n = true,

344 }
345 \AtBeginDocument{
346   \CDR_tag_keys_set:nn { __pygments } { __initialize }
347 }

```

9.2.3 \c_CDR_tag / __pygments.block l3keys module

```
348 \CDR_tag_keys_define:nn { __pygments.block } {
```

- **texcomments**[=*true|false*] If set to *true*, enables L^AT_EX comment lines. That is, L^AT_EX markup in comment tokens is not escaped so that L^AT_EX can render it. Initially *false*.

```
349 texcomments .code:n = \CDR_tag_boolean_set:x { #1 },
350 texcomments .default:n = true,
```

- **__initialize** Initializer.

```
351 __initialize .meta:n = {
352 texcomments=false,
353 },
354 __initialize .value_forbidden:n = true,

355 }
356 \AtBeginDocument{
357 \CDR_tag_keys_set:nn { __pygments.block } { __initialize }
358 }
```

9.3 Specific to coder

9.3.1 default l3keys module

```
359 \CDR_tag_keys_define:nn { default } {
```

Keys are:

- **post processor**=*<command>* the command for pygments post processor. This is a string where every occurrence of “%%file%%” is replaced by the full path of the *.pyg.tex file to be post processed and then executed as terminal instruction. Initially empty.

```
360 post~processor .code:n = \CDR_tag_set:,
361 post~processor .value_required:n = true,
```

- **parskip** the value of the \parskip in code blocks,

```
362 parskip .code:n = \CDR_tag_set:,
363 parskip .value_required:n = true,
```

- **engine**=*<engine name>* to specify the engine used to display inline code or blocks. Initially default.

```
364 engine .code:n = \CDR_tag_set:,
365 engine .value_required:n = true,
```

- **default engine options**=*<default engine options>* to specify the corresponding options,

```
366 default~engine~options .code:n = \CDR_tag_set:,
367 default~engine~options .value_required:n = true,
```

● **<engine name> engine options=<engine options>** to specify the options for the named engine,

● **__initialize** to initialize storage properly. We cannot use **.initial:n** actions because the **\l_keys_path_str** is not set up properly.

```

368 __initialize .meta:n = {
369     post-processor = ,
370     parskip = \the\parskip,
371     engine = default,
372     default-engine-options = ,
373 },
374 __initialize .value_forbidden:n = true,
375 }
376 \AtBeginDocument{
377     \CDR_tag_keys_set:nn { default } { __initialize }
378 }

```

9.3.2 default.code l3keys module

Void for the moment.

```

379 \CDR_tag_keys_define:nn { default.code } {

```

Known keys include:

● **__initialize** to initialize storage properly. We cannot use **.initial:n** actions because the **\l_keys_path_str** is not set up properly.

```

380 __initialize .meta:n = {
381 },
382 __initialize .value_forbidden:n = true,
383 }
384 \AtBeginDocument{
385     \CDR_tag_keys_set:nn { default.code } { __initialize }
386 }

```

9.3.3 default.block l3keys module

```

387 \CDR_tag_keys_define:nn { default.block } {

```

Known keys include:

● **show tags[=true|false]** to enable/disable the display of the code chunks tags. Initially true.

● **tags=<tag name comma list>** to export and display.

```

388 tags .code:n = {
389     \clist_set:Nn \l_CDR_tags_clist { #1 }
390     \clist_remove_duplicates:N \l_CDR_tags_clist
391     \exp_args:NV
392     \CDR_tag_set:n \l_CDR_tags_clist
393 },

```

```
394 show~tags .code:n = \CDR_tag_boolean_set:x { #1 },
```

- **only top[=true|false]** to avoid chunk tags repetitions, if on the same page, two consecutive code chunks have the same tag names, the second names are not displayed.

```
395 only~top .code:n = \CDR_tag_boolean_set:x { #1 },
```

- **use margin[=true|false]** to use the margin to display line numbers and tag names, or not,

```
396 use~margin .code:n = \CDR_tag_boolean_set:x { #1 },
```

- **tags format=<format>** , where <format> is used to display the tag names (mainly font, size and color),

```
397 tags~format .code:n = \CDR_tag_set:,
398 tags~format .value_required:n = true,
```

- **blockskip** the separation with the surrounding text, above and below. Initially \topsep.

```
399 blockskip .code:n = \CDR_tag_set:,
400 blockskip .value_required:n = true,
```

- **__initialize** the separation with the surrounding text. Initially \topsep.

```
401 __initialize .meta:n = {
402   tags = ,
403   show~tags = true,
404   only~top = true,
405   use~margin = true,
406   tags~format = {
407     \sffamily
408     \scriptsize
409     \color{gray}
410   },
411   blockskip = \topsep,
412 },
413 __initialize .value_forbidden:n = true,
414 }
415 \AtBeginDocument{
416   \CDR_tag_keys_set:nn { default.block } { __initialize }
417 }
```

9.4 fancyvrb

These are fancyvrb options verbatim. The fancyvrb manual has more details, only some parts are reproduced hereafter. All of these options may not be relevant for all situations. Some of them make no sense in code mode, whereas others may not be compatible with the display engine.

9.4.1 \c_CDR_tag/__fancyvrb l3keys module

```
418 \CDR_tag_keys_define:nn { __fancyvrb } {
```

- **formatcom**=*<command>* execute before printing verbatim text. Initially empty. Ignored in code mode.

```
419   formatcom .code:n = \CDR_tag_set:,
420   formatcom .value_required:n = true,
```

- **fontfamily**=** font family to use. tt, courier and helvetica are predefined. Initially tt.

```
421   fontfamily .code:n = \CDR_tag_set:,
422   fontfamily .value_required:n = true,
```

- **fontsize**=** size of the font to use. If you use the relsize package as well, you can require a change of the size proportional to the current one (for instance: **fontsize**=\relsize{-2}). Initially auto: the same as the current font.

```
423   fontsize .code:n = \CDR_tag_set:,
424   fontsize .value_required:n = true,
```

- **fontshape**=** font shape to use. Initially auto: the same as the current font.

```
425   fontshape .code:n = \CDR_tag_set:,
426   fontshape .value_required:n = true,
```

- **fontseries**=*<series name>* L^AT_EX font series to use. Initially auto: the same as the current font.

```
427   fontseries .code:n = \CDR_tag_set:,
428   fontseries .value_required:n = true,
```

- **showspaces**[=true|false] print a special character representing each space. Initially false: spaces not shown.

```
429   showspaces .code:n = \CDR_tag_boolean_set:x { #1 },
```

- **showtabs**=true|false explicitly show tab characters. Initially false: tab characters not shown.

```
430   showtabs .code:n = \CDR_tag_boolean_set:x { #1 },
```

- **obeytabs**=true|false position characters according to the tabs. Initially false: tab characters are added to the current position.

```
431   obeytabs .code:n = \CDR_tag_boolean_set:x { #1 },
```

- **tabsize**=*<integer>* number of spaces given by a tab character, Initially 2 (8 for fancyvrb).

```

432  \tabsize .code:n = \CDR_tag_set:,
433  \tabsize .value_required:n = true,

```

🔴 **defineactive**=*<macro>* to define the effect of active characters. This allows to do some devious tricks, see the `fancyvrb` package. Initially empty.

```

434  \defineactive .code:n = \CDR_tag_set:,
435  \defineactive .value_required:n = true,

```

✅ **relabel**=*<label>* define a label to be used with `\pageref`. Initially empty.

```

436  \relabel .code:n = \CDR_tag_set:,
437  \relabel .value_required:n = true,

```

✅ **__initialize** Initialization.

```

438  __initialize .meta:n = {
439    \formatcom = ,
440    \fontfamily = tt,
441    \fontsize = auto,
442    \fontseries = auto,
443    \fontshape = auto,
444    \showspaces = false,
445    \showtabs = false,
446    \obeytabs = false,
447    \tabsize = 2,
448    \defineactive = ,
449    \relabel = ,
450  },
451  __initialize .value_forbidden:n = true,

452 }
453 \AtBeginDocument{
454   \CDR_tag_keys_define:nn { __fancyvrb } { __initialize }
455 }

```

9.4.2 `__fancyvrb.block` `l3keys` module

Block specific options.

```

456 \regex_const:Nn \c_CDR_integer_regex { ^(\+|-)?\d+$ } \use_none:n { $ }
457 \CDR_tag_keys_define:nn { __fancyvrb.block } {

```

🔴 **commentchar**=*<character>* lines starting with this character are ignored. Initially empty.

```

458  \commentchar .code:n = \CDR_tag_set:,
459  \commentchar .value_required:n = true,

```

🔴 **gobble**=*<integer>* number of characters to suppress at the beginning of each line (from 0 to 9), mainly useful when environments are indented. Only `block` mode.

```

460 gobble .choices:nn = {
461   0,1,2,3,4,5,6,7,8,9
462 } {
463   \CDR_tag_choices_set:
464 },

```

- **frame=none|leftline|topline|bottomline|lines|single** type of frame around the verbatim environment. With **leftline** and **single** modes, a space of a length given by the \LaTeX `\fboxsep` macro is added between the left vertical line and the text. Initially **none**: no frame.

```

465 frame .choices:nn =
466   { none, leftline, topline, bottomline, lines, single }
467   { \CDR_tag_choices_set: },

```

- **label={[\langle top string \rangle]\langle string \rangle}** label(s) to print on top, bottom or both, frame lines. If the label(s) contains special characters, comma or equal sign, it must be placed inside a group. If an optional $\langle top\ string \rangle$ is given between square brackets, it will be used for the top line and $\langle string \rangle$ for the bottom line. Otherwise, $\langle string \rangle$ is used for both the top or bottom lines. Label(s) are printed only if the **frame** parameter is one of **topline**, **bottomline**, **lines** or **single**. Initially empty: no label.

```

468 label .code:n = \CDR_tag_set:,
469 label .value_required:n = true,

```

- **labelposition=none|topline|bottomline|all** position where to print the label(s) when defined. When options happen to be contradictory, like **frame=topline** and **labelposition=bottomline**, nothing is displayed. Initially **none** when no labels are defined, **topline** for one label and **all** otherwise.

```

470 labelposition .choices:nn =
471   { none, topline, bottomline, all }
472   { \CDR_tag_choices_set: },

```

- **numbers=none|left|right** numbering of the verbatim lines. If requested, this numbering is done outside the verbatim environment. Initially **none**: no numbering.

```

473 numbers .choices:nn =
474   { none, left, right }
475   { \CDR_tag_choices_set: },

```

- **numbersep=⟨dimension⟩** gap between numbers and verbatim lines. Initially 12pt.

```

476 numbersep .code:n = \CDR_tag_set:,
477 numbersep .value_required:n = true,

```

- **firstnumber=auto|last|⟨integer⟩** number of the first line. **last** means that the numbering is continued from the previous verbatim environment. If an integer is given, its value will be used to start the numbering. Initially **auto**: numbering starts from 1.

```

478 firstnumber .code:n = {
479   \regex_match:NnTF \c_CDR_integer_regex { #1 } {
480     \CDR_tag_set:
481   } {
482     \str_case:nnF { #1 } {
483       { auto } { \CDR_tag_set: }
484       { last } { \CDR_tag_set: }
485     } {
486       \PackageWarning
487         { CDR }
488         { Value-‘#1’~not~in~auto,~last. }
489     }
490   }
491 },
492 firstnumber .value_required:n = true,

```

- **stepnumber**=*<integer>* interval at which line numbers are printed. Initially 1: all lines are numbered.

```

493 stepnumber .code:n = \CDR_tag_set:,
494 stepnumber .value_required:n = true,

```

- **numberblanklines**[=*true|false*] to number or not the white lines (really empty or containing blank characters only). Initially **true**: all lines are numbered.

```

495 numberblanklines .code:n = \CDR_tag_boolean_set:x { #1 },

```

- **firstline**=*<integer>* first line to print. Initially empty: all lines from the first are printed.

```

496 firstline .code:n = \CDR_tag_set:,
497 firstline .value_required:n = true,

```

- **lastline**=*<integer>* last line to print. Initially empty: all lines until the last one are printed.

```

498 lastline .code:n = \CDR_tag_set:,
499 lastline .value_required:n = true,

```

- **baselinestretch**=*auto|<dimension>* value to give to the usual `\baselinestretch` \LaTeX parameter. Initially **auto**: its current value just before the verbatim command.

```

500 baselinestretch .code:n = \CDR_tag_set:,
501 baselinestretch .value_required:n = true,

```

- ⊗ **commandchars**=*<three characters>* characters which define the character which starts a macro and marks the beginning and end of a group; thus lets us introduce escape sequences in verbatim code. Of course, it is better to choose special characters which are not used in the verbatim text. Private to **coder**, unavailable to users.

- **xleftmargin**=*<dimension>* indentation to add at the start of each line. Initially **Opt**: no left margin.

```

502 xleftmargin .code:n = \CDR_tag_set:,
503 xleftmargin .value_required:n = true,

```

🔴 **xrightmargin**=*(dimension)* right margin to add after each line. Initially 0pt: no right margin.

```

504 xrightmargin .code:n = \CDR_tag_set:,
505 xrightmargin .value_required:n = true,

```

🔴 **resetmargins**[=true|false] reset the left margin, which is useful if we are inside other indented environments. Initially true.

```

506 resetmargins .code:n = \CDR_tag_boolean_set:x { #1 },

```

🔴 **hfuzz**=*(dimension)* value to give to the TeX \hfuzz dimension for text to format. This can be used to avoid seeing some unimportant overfull box messages. Initially 2pt.

```

507 hfuzz .code:n = \CDR_tag_set:,
508 hfuzz .value_required:n = true,

```

🔴 **samepage**[=true|false] in very special circumstances, we may want to make sure that a verbatim environment is not broken, even if it does not fit on the current page. To avoid a page break, we can set the samepage parameter to true. Initially false.

```

509 samepage .code:n = \CDR_tag_boolean_set:x { #1 },

```

✅ **__initialize** Initialization.

```

510 __initialize .meta:n = {
511   commentchar = ,
512   gobble = 0,
513   frame = none,
514   label = ,
515   labelposition = none,% auto?
516   numbers = left,
517   numbersep = \hspace{1ex},
518   firstnumber = auto,
519   stepnumber = 1,
520   numberblanklines = true,
521   firstline = ,
522   lastline = ,
523   baselinestretch = auto,
524   resetmargins = true,
525   xleftmargin = 0pt,
526   xrightmargin = 0pt,
527   hfuzz = 2pt,
528   samepage = false,
529 },
530 __initialize .value_forbidden:n = true,
531 }
532 \AtBeginDocument{
533   \CDR_tag_keys_set:nn { __fancyvrb.block } { __initialize }
534 }

```

9.4.3 `__fancyvrb.all` `l3keys` module

Options available when `pygments` is not used.

```
535 \CDR_tag_keys_define:nn { __fancyvrb.all } {
```

- ❗ **commandchars**=*<three characters>* characters that define the character that starts a macro and marks the beginning and end of a group; allows to introduce escape sequences in the verbatim code. Of course, it is better to choose special characters that are not used in the verbatim text! Initially **none**. Ignored in `pygments` mode.

```
536   commandchars .code:n = \CDR_tag_set:,
537   commandchars .value_required:n = true,
```

- ❗ **codes**=*<macro>* to specify catcode changes. For instance, this allows us to include formatted mathematics in verbatim text. Initially empty. Ignored in `pygments` mode.

```
538   codes .code:n = \CDR_tag_set:,
539   codes .value_required:n = true,
```

- ✅ **__initialize** Initialization.

```
540   __initialize .meta:n = {
541     commandchars = ,
542     codes = ,
543   },
544   __initialize .value_forbidden:n = true,

545 }
546 \AtBeginDocument{
547   \CDR_tag_keys_set:nn { __fancyvrb.all } { __initialize }
548 }
```

10 `\CDRSet`

```
\CDRSet \CDRSet {<key[=value] list>}
\CDRSet {only description=true, font family=tt}
\CDRSet {tag/default.code/font family=sf}
```

To set up the package. This is executed at least once at the end of the preamble. The unique mandatory argument of `\CDRSet` is a list of *<key>*[=*<value>*] items defined by the `CDR@Set` `l3keys` module.

10.1 `CDR@Set` `l3keys` module

```
549 \keys_define:nn { CDR@Set } {
```

- ❗ **only description** to typeset only the description section and ignore the implementation section.

```

550   only~description .choices:nn = { false, true, {} } {
551     \int_compare:nNnTF \l_keys_choice_int = 1 {
552       \prg_set_conditional:Nnn \CDR_if_only_description: { p, T, F, TF } { \prg_return_true: }
553     } {
554       \prg_set_conditional:Nnn \CDR_if_only_description: { p, T, F, TF } { \prg_return_false: }
555     }
556   },
557   only~description .initial:n = false
558 }

```

10.2 Branching

```

\CDR_if_only_description_p: * \CDR_if_only_description:TF {<true code>} {<false code>}
\CDR_if_only_description:TF *

```

Execute *<true code>* when only the description is expected, *<false code>* otherwise.
Implementation detail: the functions are defined as part of the CDR@Set l3keys module.

10.3 Implementation

```

\CDR_check_unknown:N \CDR_check_unknown:N {<tl variable>}

```

In normal situation, the argument is expected to be empty. When the argument is not empty, send a package warning for each key.

```

559 \exp_args_generate:n { xV, nnV }
560 \cs_new:Npn \CDR_check_unknown:N #1 {
561   \tl_if_empty:NF #1 {
562     \cs_set:Npn \CDR_check_unknown:n ##1 {
563       \PackageWarning
564         { coder }
565         { Unknow~key~'##1' }
566     }
567     \cs_set:Npn \CDR_check_unknown:nn ##1 ##2 {
568       \CDR_check_unknown:n { ##1 }
569     }
570     \exp_args:NnnV
571     \keyval_parse:nnn {
572       \CDR_check_unknown:n
573     } {
574       \CDR_check_unknown:nn
575     } #1
576   }
577 }

578 \NewDocumentCommand \CDRSet { m } {
579   \CDR_keys_set_known:nnN { CDR@Set } { #1 } \l_CDR_keyval_tl
580   \clist_map_inline:nn {
581     __pygments, __pygments.block,
582     default.block, default.code, default,
583     __fancyvrb, __fancyvrb.block, __fancyvrb.all

```

```

584 } {
585   \CDR_tag_keys_set_known:nVN { ##1 } \l_CDR_keyval_tl \l_CDR_keyval_tl
586 }
587 \CDR_keys_set_known:VNN \c_CDR_Tags \l_CDR_keyval_tl \l_CDR_keyval_tl
588 \CDR_tag_provide_from_keyval:V \l_CDR_keyval_tl
589 \CDR_tag_keys_set_known:nVN { default } \l_CDR_keyval_tl \l_CDR_keyval_tl
590 \CDR_keys_set_known:VNN \c_CDR_Tags \l_CDR_keyval_tl \l_CDR_keyval_tl
591 \CDR_check_unknown:N \l_CDR_keyval_tl
592 }

```

11 \CDRExport

\CDRExport {<key[=value] controls>}

The <key>[=<value>] controls are defined by CDR@Export l3keys module.

11.1 Storage

\c_CDR_tag_get Root identifier for tag properties, used throughout the package.
\c_CDR_slash

```

593 \str_const:Nn \c_CDR_export_get { CDR@export@get }

```

(End definition for \c_CDR_tag_get and \c_CDR_slash. These variables are documented on page ??.)

\CDR_export_get_path:cc ★ **\CDR_tag_export_path:cc** {<file name>} {<relative key path>}

Internal: return a unique key based on the arguments. Used to store and retrieve values.

```

594 \cs_new:Npn \CDR_export_get_path:cc #1 #2 {
595   \c_CDR_export_get @ #1 / #2 :
596 }

```

\CDR_export_set:ccn **\CDR_export_set:ccn** {<file name>} {<relative key path>} {<value>}

\CDR_export_set:Vcn Store <value>, which is further retrieved with the instruction **\CDR_get_get:cc** {<file name>} {<relative key path>}. All the affectations are made at the current T_EX group level.
\CDR_export_set:VcV

```

597 \cs_new_protected:Npn \CDR_export_set:ccn #1 #2 #3 {
598   \cs_set:cpn { \CDR_export_get_path:cc { #1 } { #2 } } { \exp_not:n { #3 } }
599 }
600 \cs_new_protected:Npn \CDR_export_set:Vcn #1 {
601   \exp_args:NV
602   \CDR_export_set:ccn { #1 }
603 }
604 \cs_new_protected:Npn \CDR_export_set:VcV #1 #2 #3 {
605   \exp_args:NVnV
606   \CDR_export_set:ccn #1 { #2 } #3
607 }

```

```
\CDR_export_if_exist:ccTF * \CDR_export_if_exist:ccTF {<file name>} <relative key path> {<true code>}
{<false code>}
```

If the <relative key path> is known within <file name>, the <true code> is executed, otherwise, the <false code> is executed.

```
608 \prg_new_conditional:Nnn \CDR_export_if_exist:cc { p, T, F, TF } {
609   \cs_if_exist:cTF { \CDR_export_get_path:cc { #1 } { #2 } } {
610     \prg_return_true:
611   } {
612     \prg_return_false:
613   }
614 }
```

```
\CDR_export_get:cc * \CDR_export_get:cc {<file name>} {<relative key path>}
```

The property value stored for <file name> and <relative key path>.

```
615 \cs_new:Npn \CDR_export_get:cc #1 #2 {
616   \CDR_export_if_exist:ccT { #1 } { #2 } {
617     \use:c { \CDR_export_get_path:cc { #1 } { #2 } }
618   }
619 }
```

```
\CDR_export_get:ccNTF \CDR_export_get:ccNTF {<file name>} {<relative key path>}
<tl var> {<true code>} {<false code>}
```

Get the property value stored for <file name> and <relative key path>, copy it to <tl var>. Execute <true code> on success, <false code> otherwise.

```
620 \prg_new_protected_conditional:Nnn \CDR_export_get:ccN { T, F, TF } {
621   \CDR_export_if_exist:ccTF { #1 } { #2 } {
622     \tl_set:Nx #3 { \CDR_export_get:cc { #1 } { #2 } }
623     \prg_return_true:
624   } {
625     \prg_return_false:
626   }
627 }
```

\g_CDR_export_prop Global storage for <file name>=<file export info>

```
628 \prop_new:N \g_CDR_export_prop
```

(End definition for \g_CDR_export_prop. This variable is documented on page ??.)

\l_CDR_file_tl Store the file name used for exportation, used as key in the above property list.

```
629 \tl_new:N \l_CDR_file_tl
```

(End definition for \l_CDR_file_tl. This variable is documented on page ??.)

\l_CDR_tags_clist Used by CDR@Export l3keys module to temporarily store tags during the export declaration.

```
630 \clist_new:N \l_CDR_tags_clist
```

(End definition for \l_CDR_tags_clist. This variable is documented on page ??.)

\l_CDR_export_prop Used by CDR@Export l3keys module to temporarily store properties. *Nota Bene*: nothing similar with \g_CDR_export_prop except the name.

```
631 \prop_new:N \l_CDR_export_prop
```

(End definition for \l_CDR_export_prop. This variable is documented on page ??.)

11.2 CDR@Export l3keys module

No initial value is given for every key. An `__initialize` action will set the storage with proper initial values.

```
632 \keys_define:nn { CDR@Export } {
```

● **file**=*<name>* the output file name, must be provided otherwise an error is raised.

```
633   file .tl_set:N = \l_CDR_file_tl,
634   file .value_required:n = true,
```

● **tags**=*<tags comma list>* the list of tags. No exportation when this list is void. Initially empty.

```
635   tags .code:n = {
636     \clist_set:Nn \l_CDR_tags_clist { #1 }
637     \clist_remove_duplicates:N \l_CDR_tags_clist
638     \prop_put:NVV \l_CDR_prop \l_keys_key_str \l_CDR_tags_clist
639   },
640   tags .value_required:n = true,
```

● **lang** one of the languages pygments is aware of. Initially `tex`.

```
641   lang .code:n = {
642     \prop_put:NVn \l_CDR_prop \l_keys_key_str { #1 }
643   },
644   lang .value_required:n = true,
```

● **preamble** the added preamble. Initially empty.

```
645   preamble .code:n = {
646     \prop_put:NVn \l_CDR_prop \l_keys_key_str { #1 }
647   },
648   preamble .value_required:n = true,
```

● **postamble** the added postamble. Initially empty.

```
649   postamble .code:n = {
650     \prop_put:NVn \l_CDR_prop \l_keys_key_str { #1 }
651   },
652   postamble .value_required:n = true,
```

● **raw**[`=true|false`] true to remove any additional material, false otherwise. Initially false.

```

653   raw .choices:nn = { false, true, {} } {
654     \prop_put:NVx \l_CDR_prop \l_keys_key_str {
655       \int_compare:nNnTF
656         \l_keys_choice_int = 1 { false } { true }
657     }
658   },

```

✓ **__initialize** Meta key to properly initialize all the variables.

```

659   __initialize .meta:n = {
660     __initialize_prop = #1,
661     file=,
662     tags=,
663     lang=tex,
664     preamble=,
665     postamble=,
666     raw=false,
667   },
668   __initialize .default:n = \l_CDR_prop,

```

✓ **__initialize_prop** Goody: properly initialize the local property storage.

```

669   __initialize_prop .code:n = \prop_clear:N #1,
670   __initialize_prop .default:n = \l_CDR_prop,
671 }

```

11.3 Implementation

```

672 \NewDocumentCommand \CDRExport { m } {
673   \keys_set:nn { CDR@Export } { __initialize }
674   \keys_set:nn { CDR@Export } { #1 }
675   \tl_if_empty:NTF \l_CDR_file_tl {
676     \PackageWarning
677       { coder }
678       { Missing~key~‘file’ }
679   } {
680     \CDR_export_set:VcV \l_CDR_file_tl { file } \l_CDR_file_tl
681     \prop_map_inline:Nn \l_CDR_prop {
682       \CDR_export_set:Vcn \l_CDR_file_tl { ##1 } { ##2 }
683     }

```

If a `lang` is given, forwards the declaration to all the tagged chunks.

```

684     \prop_get:NnNT \l_CDR_prop { tags } \l_CDR_tags_clist {
685       \exp_args:NV
686       \CDR_export_get:ccNT \l_CDR_file_tl { lang } \l_CDR_tl {
687         \clist_map_inline:Nn \l_CDR_tags_clist {
688           \CDR_tag_set:ccV { ##1 } { lang } \l_CDR_tl
689         }
690       }
691     }
692   }
693 }

```

Files are created at the end of the typesetting process.

```

694 \AddToHook { enddocument / end } {
695   \prop_map_inline:Nn \g_CDR_export_prop {
696     \tl_set:Nn \l_CDR_prop { #2 }
697     \str_set:Nx \l_CDR_str {
698       \prop_item:Nn \l_CDR_prop { file }
699     }
700     \lua_now:n { CDR:export_file('l_CDR_str') }
701     \clist_map_inline:nn {
702       tags, raw, preamble, postamble
703     } {
704       \str_set:Nx \l_CDR_str {
705         \prop_item:Nn \l_CDR_prop { ##1 }
706       }
707       \lua_now:n {
708         CDR:export_file_info('##1','l_CDR_str')
709       }
710     }
711     \lua_now:n { CDR:export_file_complete() }
712   }
713 }

```

12 Style

pygments, through `coder-tool.py`, creates style commands, but the storage is managed on the L^AT_EX side by `coder.sty`.

12.1 Storage

`\g_CDR_style_prop` Storage for styles, the keys are style names as understood by pygments.

```

714 \prop_new:N \l_CDR_style_prop

```

(End definition for `\g_CDR_style_prop`. This variable is documented on page ??.)

12.2 Managements

`\CDR@StyleDefine` `\CDR@StyleDefine {<style name>} {<style commands>}`

Store the `<style commands>` under `<style name>`.

```

715 \cs_new:Npn \CDR@StyleDefine {
716   \prop_put:Nnn \l_CDR_style_prop
717 }

```

13 Creating display engines

13.1 Utilities

<code>\CDR_code_engine:c</code>	★	<code>\CDR_code_engine:c {⟨engine name⟩}</code>
<code>\CDR_code_engine:V</code>	★	<code>\CDR_block_engine:c {⟨engine name⟩}</code>
<code>\CDR_block_engine:c</code>	★	<code>\CDR_code_engine:c</code> builds a command sequence name based on <code>⟨engine name⟩</code> .
<code>\CDR_block_engine:V</code>	★	<code>\CDR_block_engine:c</code> builds an environment name based on <code>⟨engine name⟩</code> .

```

718 \cs_new:Npn \CDR_code_engine:c #1 {
719   CDR@colored/code/#1:n
720 }
721 \cs_new:Npn \CDR_block_engine:c #1 {
722   CDR@colored/block/#1
723 }
724 \cs_new:Npn \CDR_code_engine:V {
725   \exp_args:NV \CDR_code_engine:c
726 }
727 \cs_new:Npn \CDR_block_engine:V {
728   \exp_args:NV \CDR_block_engine:c
729 }
```

`\l_CDR_engine_tl` Storage for an engine name.

```
730 \tl_new:N \l_CDR_engine_tl
```

(End definition for `\l_CDR_engine_tl`. This variable is documented on page ??.)

<code>\CDRGetOption</code>	<code>\CDRGetOption {⟨relative key path⟩}</code>
----------------------------	--

Returns the value given to `\CDRCode` command or `CDRBlock` environment for the `⟨relative key path⟩`. This function is only available during `\CDRCode` execution and inside `CDRBlock` environment.

13.2 Implementation

<code>\CDRNewCodeEngine</code>	<code>\CDRNewCodeEngine {⟨engine name⟩}{⟨engine body⟩}</code>
<code>\CDRRenewCodeEngine</code>	<code>\CDRRenewCodeEngine{⟨engine name⟩}{⟨engine body⟩}</code>

`⟨engine name⟩` is a non void string, once expanded. The `⟨engine body⟩` is a list of instructions which may refer to the first argument as `#1`, which is the value given for key `⟨engine name⟩` engine options, and the second argument as `#2`, which is the colored code.

```

731 \NewDocumentCommand \CDRNewCodeEngine { mm } {
732   \exp_args:Nx
733   \tl_if_empty:nTF { #1 } {
734     \PackageWarning
735       { coder }
736       { The~engine~cannot~be~void. }
737   } {
738     \cs_new:cpn { \CDR_code_engine:c {#1} } ##1 {
739       \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
```

```

740     #2
741   }
742   \ignorespaces
743 }
744 }

745 \NewDocumentCommand \CDRRenewCodeEngine { mm } {
746   \exp_args:Nx
747   \tl_if_empty:nTF { #1 } {
748     \PackageWarning
749       { coder }
750       { The~engine~cannot~be~void. }
751     \use_none:n
752   } {
753     \cs_if_exist:cTF { \CDR_code_engine:c { #1 } } {
754       \cs_set:cpn { \CDR_code_engine:c { #1 } } ##1 {
755         \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
756         #2
757       }
758     } {
759       \PackageWarning
760         { coder }
761         { No~code~engine~#1.}
762     }
763     \ignorespaces
764   }
765 }

```

`\CDR_apply_code_engine:n` `\CDR_apply_code_engine:n {<verbatim code>}`

Get the code engine and apply. When the code engine is not recognized, an error is raised.

```

766 \cs_set:Npn \CDR_apply_code_engine:n {
767   \tl_set:Nx \l_CDR_tl { \CDR_tag_get:c { engine } }
768   \CDR_if_code_engine:VTF \l_CDR_tl {
769     \use:c { \CDR_code_engine:V \l_CDR_tl }
770   } {
771     \PackageError
772       { coder }
773       { \l_CDR_tl\space code-engine-unknown,~replaced-by-'default' }
774       {See~\CDRNewCodeEngine~in~the~coder~manual}
775     \use:c { \CDR_code_engine:c { default } }
776   }
777 }

```

<code>\CDRNewBlockEngine</code> <code>\CDRRenewBlockEngine</code>	<code>\CDRNewBlockEngine {<engine name>} {<begin instructions>} {<end instructions>}</code> <code>\CDRRenewBlockEngine {<engine name>} {<begin instructions>} {<end instructions>}</code>
--	---

Create a L^AT_EX environment uniquely named after `<engine name>`, which must be a non void string once expanded. The `<begin instructions>` and `<end instructions>` are list of instructions which may refer to the unique argument as `#1`, which is the value given to CDRBlock environment for key `<engine name>` engine options. Various options are available with the `\CDRGetOption` function. *Implementation detail:* the third argument is parsed by `\NewDocumentEnvironment`.

```

778 \NewDocumentCommand \CDRNewBlockEngine { mm } {
779   \NewDocumentEnvironment { \CDR_block_engine:c { #1 } } { m } {
780     \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
781     #2
782   }
783 }

784 \NewDocumentCommand \CDRRenewBlockEngine { mm } {
785   \tl_if_empty:nTF { #1 } {
786     \PackageWarning
787     { coder }
788     { The~engine~cannot~be~void. }
789     \use_none:n
790   } {
791     \RenewDocumentEnvironment { \CDR_block_engine:c { #1 } } { m } {
792       \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
793       #2
794     }
795   }
796 }

```

13.3 Conditionals

\CDR_if_code_engine:cTF ★ \CDR_if_code_engine:cTF {<engine name>} {<true code>} {<false code>}

If there exists a code engine with the given <engine name>, execute <true code>. Otherwise, execute <false code>.

```

797 \prg_new_conditional:Nnn \CDR_if_code_engine:c { p, T, F, TF } {
798   \cs_if_exist:cTF { \CDR_code_engine:c { #1 } } {
799     \prg_return_true:
800   } {
801     \prg_return_false:
802   }
803 }

804 \prg_new_conditional:Nnn \CDR_if_code_engine:V { p, T, F, TF } {
805   \cs_if_exist:cTF { \CDR_code_engine:V #1 } {
806     \prg_return_true:
807   } {
808     \prg_return_false:
809   }
810 }

```

\CDR_has_block_engine:cTF ★ \CDR_has_block_engine:c {<engine name>} {<true code>} {<false code>}

If there exists a block engine with the given <engine name>, execute <true code>, otherwise, execute <false code>.

```

811 \prg_new_conditional:Nnn \CDR_has_block_engine:c { p, T, F, TF } {
812   \cs_if_exist:cTF { \CDR_block_engine:c { #1 } } {
813     \prg_return_true:
814   } {
815     \prg_return_false:

```

```

816   }
817 }
818 \prg_new_conditional:Nnn \CDR_has_block_engine:V { p, T, F, TF } {
819   \cs_if_exist:cTF { \CDR_block_engine:V #1 } {
820     \prg_return_true:
821   } {
822     \prg_return_false:
823   }
824 }

```

13.4 Default code engine

The default code engine does nothing special and forwards its argument as is.

```

825 \CDRNewCodeEngine { default } { #1 }

```

13.5 Default block engine

The default block engine does nothing.

```

826 \CDRNewBlockEngine { default } { } { }

```

14 \CDRCode function

14.1 Storage

`\l_CDR_tag_tl` To store the tag given.

```

827 \tl_new:N \l_CDR_tag_tl

```

(End definition for \l_CDR_tag_tl. This variable is documented on page ??.)

14.2 `_CDR_tag / __code l3keys` module

This is the module used to parse the user interface of the `\CDRCode` command.

```

828 \CDR_tag_keys_define:nn { __code } {

```

 **tag=<name>** to use the settings of the already existing named tag to display.

```

829   tag .tl_set:N = \l_CDR_tag_tl,
830   tag .value_required:n = true,

```

 **__initialize** initialize

```

831   __initialize .meta:n = {
832     tag = default,
833   },
834   __initialize .value_forbidden:n = true,
835 }

```

14.3 Implementation

```

941     }
942   }
943 }
```

15 CDRBlock environment

`CDRBlock` `\begin{CDRBlock}{<key[=value] list>} ... \end{CDRBlock}`

15.1 Storage

`\l_CDR_block_prop`

```
944 \prop_new:N \l_CDR_block_prop
```

(End definition for `\l_CDR_block_prop`. This variable is documented on page ??.)

15.2 `__block l3keys` module

This module is used to parse the user interface of the `CDRBlock` environment.

```
945 \CDR_tag_keys_define:nn { __block } {
```

 **ignore**[=`true|false`] to ignore this code chunk.

```
946   ignore .code:n = \CDR_tag_boolean_set:x { #1 },
947   ignore .default:n = true,
```

 **test**[=`true|false`] whether the chunk is a test,

```
948   test .code:n = \CDR_tag_boolean_set:x { #1 },
949   test .default:n = true,
```

 **engine options**=`<engine options>` exact options forwarded to the engine. Normally, options are appended to the default ones, assuming a key-value interface.

```
950   engine-options .code:n = \CDR_tag_set:,
951   engine options .default:n = true,
```

 **__initialize** initialize

```

952 __initialize .meta:n = {
953     tags = ,
954     ignore = false,
955     test= false,
956 },
957 __initialize .value_forbidden:n = true,
958 }

```

15.3 Context

Inside the CDRBlock environments, some local variables are available:

● `\l_CDR_tags_clist`

15.4 Implementation

We start by saving some fancyvrb macros that we further want to extend. The unique mandatory argument of these macros will eventually be recorded to be saved later on.

```

959 \clist_map_inline:nn { i, ii, iii, iv } {
960     \cs_set_eq:cc { CDR@ListProcessLine@ #1 } { FV@ListProcessLine@ #1 }
961 }
962 \cs_new:Npn \CDR_process_line:n #1 {
963     \str_set:Nn \l_CDR_str { #1 }
964     \lua_now:n {CDR:process_line('l_CDR_str')}
965 }

966 \cs_new:Npn \CDR_keys_inherit__:nnn #1 #2 #3 {
967     \keys_define:nn { #1 } { #2 .inherit:n = { #3 } }
968 }
969 \cs_new:Npn \CDR_keys_inherit:nnn #1 #2 #3 {
970     \tl_if_empty:nTF { #1 } {
971         \CDR_keys_inherit__:nnn { } { #2 } { #3 }
972     } {
973         \clist_set:Nn \l_CDR_clist { #3 }
974         \exp_args:Nnn
975         \CDR_keys_inherit__:nnn { #1 } { #2 } {
976             #1 / \clist_use:Nn \l_CDR_clist { ,#1/ }
977         }
978     }
979 }
980 \cs_generate_variant:Nn \CDR_keys_inherit:nnn { VnV, Vnn }
981 \def\FVB@CDRBlock #1 {
982     \@bsphack
983     \group_begin:
984     \prg_set_conditional:Nnn \CDR_if_block: { p, T, F, TF } {
985         \prg_return_true:
986     }
987     \clist_set:Nn \l_tmpa_clist {

1065

```

17 More

```

\CDR_if_record:TF ★ \CDR_if_record:TF {\true code} {\false code}

```

Execute `\true code` when code should be recorded, `\false code` otherwise. The code should be recorded for the `CDRBlock` environment when there is a non empty list of tags and `pygment` is used. *Implementation details*: we assume that if `\l_CDR_tags_clist` is not empty then we are in a `CDRBlock` environment.

```

1066 \prg_new_conditional:Nnn \CDR_if_record: { T, F, TF } {

24 Display engines

Inserting code snippets follows one of two modes: run or block. The former is displayed as running text and used by the `\CDRCode` command whereas the latter is displayed as a separate block and used by the `CDRBlock` environment. Both have one single required argument, which is a *key-value* configuration list conforming to `CDR_code` `l3keys` module. The contents is then colored with the aid of `coder-tool.py` which will return some code enclosed within an environment created by one of `\CDRNewCodeEngine`, `\CDRRenewCodeEngine`, `\CDRNewBlockEngine`, `\CDRRenewBlockEngine` functions.

24.1 Run mode efbox engine

`CDRCallWithOptions` ★ `\CDRCallWithOptions<cs>`

Call *<cs>*, assuming it has a first optional argument. It will receive the arguments passed to `\CDRCode` with the `options` key.

```

1631 \cs_new:Npn \CDRCallWithOptions #1 {
1632   \exp_last_unbraced:NNx
1633   #1[\CDR:n { options }]
1634 }
1635 \CDRNewCodeEngine {efbox} {
1636   \CDRCallWithOptions\efbox{#1}%
1637 }

```

24.2 Block mode default engine

```

1638 \CDRNewBlockEngine {} {
1639 } {
1640 }

```

24.3 options key-value controls

We accept any value because we do not know in advance the real target. Everything is collected in `\l_CDR_options_clist`.

`\l_CDR_options_clist` All the *<key[=value] items>* passed as options are collected here. This should be cleared before arguments are parsed.

(End definition for `\l_CDR_options_clist`. This variable is documented on page ??.)

There are 2 ways to collect options:

25 Something else
