# coder — code inlined in a LATEX document\*

## Jérôme LAURENS<sup>†</sup>

# Released 2022/02/07

#### Abstract

Usually, documentation is put inside the code, coder allows to work the other way round by putting code inside the documentation. This is particularly interesting when different code files share some logic and should be documented all at once. The file coder-manual.pdf gives different examples. Here is the implementation of the package.

This  $\LaTeX$  package requires LuaTeX and may use syntax coloring based on pygments.

# 1 Package dependencies

luacode, datetime2, xcolor, fancyvrb and dependencies of these packages.

# 2 Similar technologies

The docstrip utility offers similar features, it is somehow more powerful than coder at the cost of more technicality and less practicality,

The ydoc.cls and skdoc.cls are full document classes with similar features but many more that are unrelated. coder focuses on code inlining and interfaces very well with pygments for a smart and efficient syntax hilighting.

The pygmentex and minted packages were somehow a source of inspiration.

# 3 Known bugs and limitations

• coder does not play well with docstrip.

<sup>\*</sup>This file describes version 2022/02/07, last revised 2022/02/07.

 $<sup>^{\</sup>dagger}\mbox{E-mail: jerome.laurens@u-bourgogne.fr}$ 

# 4 Namespace and conventions

IATEX identifiers related to coder start with CDR, including both commands and evironments. expl3 identifiers also start with CDR, after and eventual leading c\_, l\_ or g\_. l3keys module path's first component is either CDR or starts with CDR@.

lua objects (functions and variables) are collected in the CDR table automatically created while loading coder-util.lua from coder.sty.

The c argument specifier is used here in a more general acception. Normaly , it means that the argument is turned to a command sequence name. Here, it means that the argument is part of something bigger which is turned to a command sequence name. As such, there is no need to explictly expand such an argument.

# 5 Presentation

coder is a triptych of three complementary components

- 1. coder.sty, on the LATEX side,
- 2. coder-util.lua, to store data and call coder-tool.py,
- 3. coder-tool.py, to color code with the help of pygments.

coder.sty mainly declares the \CDRCode command and the CDRBlock environment. The former allows to insert code chunks as running text whereas the latter allows to instert code snippets as blocks. Moreover, block code chunks can be exported to files, once declared with \CDRExport command. The \CDRSet command is used to set various parameters, including display engines declared with either \CDRCodeEngineNew or \CDRBlockEngineNew.

### 5.1 Code flow

The normal code flow is

- from coder.sty, IATEX parses a code snippet as \CDRCode argument of CDRBlock environment body, somehow stores it, and calls either CDR:hilight\_code or CDR:hilight\_block,
- 2. coder-util.lua reads the content of some command, and stores it in a json file, together with informations to process this code snippet properly,
- 3. coder-tool.py is asked by coder-util.lua to read the json file and eventually uses pygments to translate the code snippet into dedicated LATEX coloring commands. These are stored in a \*.pyg.tex file named after the md5 digest of the original code chunck, a \*.pyg.sty LATEX style file is recorded as well. On return, coder-tool.py gives to coder-util.lua some LATEX instructions to both input the \*.pyg.sty and the \*.pyg.tex file, these are finally executed and the code is displayed with colors. coder-tool.py is also partially responsible of code line numbering.

The package coder.sty only exchanges with coder-util.lua using \directlua and tex.print. coder-tool.py in turn only exchanges with coder-util.lua: we put in coder-tool.py as few IATEX logic as possible. It receives instructions from coder.sty as command line arguments, IATEX options, pygments options and fancyvrb options.

## 5.2 File exports

- The \CDRExport command declares a file path, a list of tags and other usefull
  information like a coding language. These data are saved as export records by
  coder-util.lua.
- 2. When some tags={...} have been given to the CDRBlock environment, the coderutil.lua records the corresponding code chunk and its associate tags for later save.
- 3. Once the typesetting process is complete, coder-util.lua's CDR\_export\_... methods are called to save all the files externally. For each export record, coder-util.lua collects all the chunks with the same tag and save them at the proper location.

## 5.3 Display engine

The display management is partly delegated to other packages. coder.sty provides default engines for running code and code blocks, and new engines can be declared with \CDRCodeEngineNew and \CDRBlockEngineNew.

# 5.4 LATEX user interface

The first required argument of both commands and environment is a \( \key[=value] \) controls \( \) list managed by |3keys. Each command requires its own |3keys module but some \( \key[=value] \) controls \( \) are shared between modules.

## 5.5 Properties and inheritance

Properties cover various informations, from the language of the code, to the color and font. They are uniquely identified by a path component, the tag, which is used for inheritance. All tags starting with two leading underscore characters are reserved by the package. Other tags are at the user disposal.

Each processed code chunk has a list of associate tags. Most tag inherits from default ones.

# 6 Options

Key-value options allow the user, coder.sty, coder-util.lua and CDRPy to exchange data. What the user is allowed to do is detailed in coder-manual.pdf.

## 6.1 fancyvrb

These are fancyvrb options verbatim. The fancyvrb manual has more details, only some parts are reproduced hereafter. All of these options may not be relevant for all situations. Some of them make no sense in code mode, whereas others may not be compatible with the display engine.

- formatcom=(command) execute before printing verbatim text. Initially empty. Ignored in code mode.
- fontfamily=\(\frac{family name}\) font family to use. tt, courier and helvetica are predefined. Initially tt.

- fontsize=\( font size \) size of the font to use. If you use the relsize package as well, you can require a change of the size proportional to the current one (for instance: fontsize=\relsize{-2}). Initially auto: the same as the current font.
- fontshape=\langle font shape \rangle font shape to use. Initially auto: the same as the current font.
- showspaces[=true|false] print a special character representing each space. Initially false: spaces not shown.
- showtabs=true|false explicitly show tab characters. Initially false: tab characters not shown.
- obeytabs=true|false position characters according to the tabs. Initially false: tab characters are added to the current position.
- tabsize=(integer) number of spaces given by a tab character, Initially 2 (8 for fancyvrb).
- defineactive=\langle macro \rangle to define the effect of active characters. This allows to do some devious tricks, see the fancyvrb package. Initially empty.
- **▼** reflabel=(label) define a label to be used with \pageref. Initially empty.
- commentchar=(character) lines starting with this character are ignored. Initially empty.
- **gobble=**(integer) number of characters to suppress at the beginning of each line (from 0 to 9), mainly useful when environments are indented. Only block mode.
- frame=none|leftline|topline|bottomline|lines|single type of frame around the verbatim environment. With leftline and single modes, a space of a length given by the LATEX \fboxsep macro is added between the left vertical line and the text. Initially none: no frame.
- label={[⟨top string⟩] ⟨string⟩} label(s) to print on top, bottom or both, frame lines. If the label(s) contains special characters, comma or equal sign, it must be placed inside a group. If an optional ⟨top string⟩ is given between square brackets, it will be used for the top line and ⟨string⟩ for the bottom line. Otherwise, ⟨string⟩ is used for both the top or bottom lines. Label(s) are printed only if the frame parameter is one of topline, bottomline, lines or single. Initially empty: no label.
- labelposition=none|topline|bottomline|all position where to print the label(s) when defined. When options happen to be contradictory, like frame=topline and labelposition=bottomline, nothing is displayed. Initially none when no labels are defined, topline for one label and all otherwise.
- numbers=none|left|right numbering of the verbatim lines. If requested, this numbering is done outside the verbatim environment. Initially none: no numbering.
- numbersep=(dimension) gap between numbers and verbatim lines. Initially 12pt.

- firstnumber=auto|last|⟨integer⟩ number of the first line. last means that the numbering is continued from the previous verbatim environment. If an integer is given, its value will be used to start the numbering. Initially auto: numbering starts from
- stepnumber=(integer) interval at which line numbers are printed. Initially 1: all lines are numbered.
- numberblanklines[=true|false] to number or not the white lines (really empty or containing blank characters only). Initially true: all lines are numbered.
- firstline=\(\langle integer \rangle \) first line to print. Initially empty: all lines from the first are printed.
- lastline=(integer) last line to print. Initially empty: all lines until the last one are printed.
- baselinestretch=auto|\dimension\) value to give to the usual \baselinestretch IATEX parameter. Initially auto: its current value just before the verbatim command.
- **©** commandchars=\langle three characters \rangle characters which define the character which starts a macro and marks the beginning and end of a group; thus lets us introduce escape sequences in verbatim code. Of course, it is better to choose special characters which are not used in the verbatim text. Private to coder, unavailable to users.
- xleftmargin=(dimension) indentation to add at the start of each line. Initially Opt: no left margin.
- xrightmargin=(dimension) right margin to add after each line. Initially Opt: no right margin.
- resetmargins [=true|false] reset the left margin, which is useful if we are inside other indented environments. Initially true.
- hfuzz=\(dimension\) value to give to the TeX \hfuzz dimension for text to format. This can be used to avoid seeing some unimportant overfull box messages. Initially 2pt.
- samepage[=true|false] in very special circumstances, we may want to make sure that a verbatim environment is not broken, even if it does not fit on the current page. To avoid a page break, we can set the samepage parameter to true. Initially false.

### 6.2 pygments options

These are pygments's LatexFormatter options, used only by coder-util.lua to communicate with coder-tool.py.

- $\blacksquare$  style= $\langle name \rangle$  the pygments style to use. Initially default.
- **Solution** full Tells the formatter to output a full document, i.e. a complete self-contained document (default: false). Forbidden.
- **\Omega title** If **full** is true, the title that should be used to caption the document (default empty). Forbidden.

- oencoding If given, must be an encoding name. This will be used to convert the Unicode token strings to byte strings in the output. If it is or None, Unicode strings will be written to the output file, which most file-like objects do not support (default: None).
- outencoding Overrides encoding if given.
- Odocclass If the full option is enabled, this is the document class to use (default: article). Forbidden.
- opreamble If the full option is enabled, this can be further preamble commands, e.g. "\usepackage" (default empty). Forbidden.
- O linenos[=true|false] If set to true, output line numbers. Initially false: no numbering. Ignored in code mode.
- O linenostart=(integer) The line number for the first line. Initially 1: numbering starts from 1. Ignored in code mode.
- **O** linenostep= $\langle integer \rangle$  If set to a number n > 1, only every nth line number is printed. Ignored in code mode. Additional options given to the Verbatim environment (see the fancyvrb docs for possible values). Initially empty.
- verboptions Forbidden.
- commandprefix=\langle text \rangle The LaTeX commands used to produce colored output are constructed using this prefix and some letters. Initially PY.
- texcomments [=true|false] If set to true, enables LATEX comment lines. That is, LATEX markup in comment tokens is not escaped so that LATEX can render it. Initially false. Ignored in code mode.
- mathescape[=true|false] If set to true, enables LaTeX math mode escape in comments.

  That is, \$...\$ inside a comment will trigger math mode. Initially false.
- escapeinside=\langle before \rangle \langle after \rangle If set to a string of length 2, enables escaping to LATEX. Text delimited by these 2 characters is read as LaTeX code and typeset accordingly. It has no effect in string literals. It has no effect in comments if texcomments or mathescape is set. Initially empty.
- envname=(name) Allows you to pick an alternative environment name replacing Verbatim.
  The alternate environment still has to support Verbatim's option syntax. Initially Verbatim.

## 6.3 LATEX

These are options used by coder.sty to pass data to coder-tool.py. All values are required, possibly empty.

- tags clist of tag names, used for line numbering.
- inline true when inline code is concerned, false otherwise.
- ignore\_style true when the style has already been defined, false otherwise,

- **sty\_template** LATEX source text where <placeholder:style\_defs> must be replaced by the style definitions provided by pygments. It may include the style name.
- code\_template IATEX source text where <placeholder:hilighted> should be replaced by the hilighted code provided by pygments.
- block\_template IATEX source text where <placeholder:count> should be replaced by the count of numbered lines (not all lines may be numbered) and <placeholder:hilighted> should be replaced by the hilighted code provided by pygments.

All the line templates below are LATEX source text where <placeholder:number> should be replaced by a line number and <placeholder:line> should be replaced by the hilighted line code provided by pygments. They should not include a trailing newline char.

- single\_line\_template It may contain tag related information and number as well.
  When the block consists of only one line.
- first\_line\_template When the block consists of more than one line. If the tag information is required or new, display only the tag. Display the number if required, otherwise.
- second\_line\_template If the first line did not, display the line number, but only when required.
- black\_line\_template for numbered lines,
- white\_line\_template for unnumbered lines,

## File I

# coder-util.lua implementation

# 1 Usage

This lua library is loaded by coder.sty with the instruction CDR=require(coder-util). In the sequel, the syntax to call class methods and instance methods are presented with either a CDR. or a CDR: prefix. This is what is used in the library for convenience. Of course either a self. or a self: prefix would be possible.

# 2 Declarations

```
1 %<*lua>
2 local lfs = _ENV.lfs
3 local tex = _ENV.tex
4 local token = _ENV.token
5 local md5 = _ENV.md5
6 local kpse = _ENV.kpse
7 local rep = string.rep
8 local lpeg = require("lpeg")
9 local P, Cg, Cp, V = lpeg.P, lpeg.Cg, lpeg.Cp, lpeg.V
10 local json = require('lualibs-util-jsn')
```

# 3 General purpose material

```
CDR_PY_PATH Location of the coder-tool.py utility. This will cause an error if kpsewhich is not available.
                  The PATH must be properly set up.
                11 local CDR_PY_PATH = kpse.find_file('coder-tool.py')
                  (End definition for CDR_PY_PATH. This variable is documented on page ??.)
    PYTHON_PATH Location of the python utility, defaults to 'python'.
                12 local PYTHON_PATH = io.popen([[which python]]):read('a'):match("^%s*(.-)%s*$")
                  (End definition for PYTHON PATH. This variable is documented on page ??.)
set_python_path
                  CDR:set_python_path(\langle path var \rangle)
                  Set manually the path of the python utility with the contents of the (path var). If the
                  given path does not point to a file or a link then an error is raised.
                13 local function set_python_path(self, path_var)
                    local path = assert(token.get_macro(assert(path_var)))
                    if #path>0 then
                       local mode,_,_ = lfs.attributes(self.PYTHON_PATH,'mode')
                       assert(mode == 'file' or mode == 'link')
                17
                18

         return rep('=', max + 1)
77
       end
78
      i = j - i
79
       if i > max then
80
        max = i
81
       end
82
    end
83 end
```

load\_exec

CDR:load\_exec(\( \) lua code chunk \( \) )

Class method. Loads the given (lua code chunk) and execute it. On error, messages are printed.

```
84 local function load_exec(self, chunk)
    local env = setmetatable({ self = self, tex = tex }, _ENV)
85
    local func, err = load(chunk, 'coder-tool', 't', env)
86
87
    if func then
88
      local ok
89
      ok, err = pcall(func)
90
      if not ok then
        print("coder-util.lua Execution error:", err)
91
        print('chunk:', chunk)
92
      end
93
    else
94
      print("coder-util.lua Compilation error:", err)
95
      print('chunk:', chunk)
96
97
    end
98 end
```

load\_exec\_output

CDR:load\_exec\_output(\langle lua code chunk\rangle)

Instance method to parse the \(\lambda \) ua code chunk\\ sring for commands and execute them. The patterns being searched are enclosed within opening <<<< and closing >>>>, each containing 5 characters,

?TEX: $\langle \text{TeX instructions} \rangle$  the  $\langle \text{TeX instructions} \rangle$  are executed asynchronously once the control comes back to TeX.

!LUA:(!Lua instructions) the (!Lua instructions) are executed synchronously. When not properly designed, these instruction may cause a forever loop on execution, for example, they must not use CDR:if\_code\_engine.

?LUA:(?Lua instructions) these (?Lua instructions) are executed asynchronously once the control comes back to TeX through a call to \directlua, which means that they will wait until any previous asynchronous (?TeX instructions) or (?Lua instructions) completes.

```

330
```

```
hilight_advance
```

```
{\tt CDR:hilight\_advance}(\langle count \rangle)
```

⟨count⟩ is the number of line hilighted.

- 332 local function hilight\_advance(self, count)
- 333 end

# 6 Exportation

For each file to be exported, coder.sty calls export\_file to initialte the exportation. Then it calls export\_file\_info to share the tags, raw, preamble, postamble data. Finally, export\_complete is called to complete the exportation.

### export\_file

```
CDR:export_file(\langle file name var \rangle)
```

This is called at export time.  $\langle file\ name\ var \rangle$  is the name of an str variable containing the file name.

```
334 local function export_file(self, file_name)
335    self['.name'] = assert(token.get_macro(assert(file_name)))
336    self['.export'] = {}
337 end
```

#### export\_file\_info

```
CDR:export_file_info(\langle key \rangle, \langle value name var \rangle)
```

This is called at export time. (value name var) is the name of an str variable containing the value.

```
338 local function export_file_info(self, key, value)
339 local export = self['.export']
340 value = assert(token.get_macro(assert(value)))
341 export[key] = value
342 end
```

### export\_complete

CDR:export\_complete()

This is called at export time.

```
343 local function export_complete(self)
                   = self['.name']
     local name
344
     local export = self['.export']
345
     local records = self['.records']
346
     local tt = {}
347
     local s = export.preamble
348
349
     if s then
       tt[#tt+1] = s
350
351
     for _,tag in ipairs(export.tags) do
352
353
       s = records[tag]:concat('\n')
       tt[#tt+1] = s
354
```

```
records[tag] = { [1] = s }
355
     end
356
     s = export.postamble
357
     if s then
358
        tt[#tt+1] = s
359
360
     if #tt>0 then
361
        local fh = assert(io.open(name,'w'))
362
363
        fh:write(tt:concat('\n'))
        fh:close()
364

366
     self['.exportation'] = nil
367
368 end
```

# 7 Caching

We save some computation time by pygmentizing files only when necessary. The codertool.py is expected to create a \*.pyg.sty file for a style and a \*.pyg.tex file for hilighted code. These files are cached during one whole IATEX run and possibly between different IATEX runs. Lua keeps track of both the style files created and hilighted code files created.

cache\_clean\_all
cache\_record
cache\_clean\_unused

```
\label{lem:condition} \begin{split} & \texttt{CDR:cache\_clean\_all()} \\ & \texttt{CDR:cache\_record}(\langle style\ name.pyg.sty \rangle,\ \langle digest.pyg.tex \rangle) \\ & \texttt{CDR:cache\_clean\_unused()} \end{split}
```

Instance methods. cache\_clean\_all removes any file in the cache directory named \( \lambda jobname \rangle .pygd \). This is automatically executed at the beginning of the document processing when there is no aux file. This can also be executed on demand with \( \directlua{CDR:cache\_clean\_all()}. \) The cache\_record method stores both \( \style name.pyg.sty \rangle \) and \( \digest.pyg.tex \rangle . \) These are file names relative to the \( \lambda jobname \rangle .pygd \) directory. cache\_clean\_unused removes any file in the cache directory \( \lambda jobname \rangle .pygd \) except the ones that were previously recorded. This is executed at the end of the document processing.

```
369 local function cache_clean_all(self)
     local to_remove = {}
     for f in lfs.dir(dir_p) do
371
       to_remove[f] = true
372
373
     for k,_ in pairs(to_remove) do

## File II

# coder-tool.py implementation

The standard header is managed specially because of the way docstrip automatically adds some header when extracting stuff from an archive. The next two lines are added by docstrip at the top of the preamble.

```
1 %<*py>
2 #! /usr/bin/env python3
3 # -*- coding: utf-8 -*-4 %</py>
```

# 1 Usage

Run: coder-tool.py -h.

# 2 Header and global declarations

```
5 %<*py>
6 __version__ = '0.10'
7 __YEAR__ = '2022'
8 __docformat__ = 'restructuredtext'
9

10 import sys
11 import os
12 import argparse
13 import re
14 from pathlib import Path
15 import json
16 from pygments import highlight as hilight
17 from pygments.formatters.latex import LatexEmbeddedLexer, LatexFormatter
18 from pygments.util import ClassNotFound
```

# 3 Options classes

Object is used to turn a dictionary into a full fledged object. The real class is given by the \_\_cls\_\_ key.

```
20 class BaseOpts(object):
    @staticmethod
21
22
    def ensure_bool(x):
23
      if x == True or x == False: return x
24
      x = x[0:1]
      return x == T' or x == t'
25
    def __init__(self, d={}):
26
      for k, v in d.items():
27
        if type(v) == str:
28
          if v.lower() == 'true':
29
            setattr(self, k, True)
            continue
          elif v.lower() == 'false':
33
            setattr(self, k, False)
            continue
34
        setattr(self, k, v)
35
```

## 3.1 TeXOpts class

```
36 class TeXOpts(BaseOpts):
37  tags = ''
38  inline = True
39  ignore_style = False
40  ignore_source = False
```

The templates are provided by coder.sty. The style template wraps the style definitions provided by pygments. It may include the style name

```
sty_template=r'', '% !TeX root=...
43
44 \makeatletter
45 \CDR@StyleDefine{<placeholder:style_name>}{%
    <placeholder:style_defs>}%
46
47 \makeatother','
    code_template =r'', '% !TeX root=...
48
49 \makeatletter
50 \CDR@StyleUseTag%
51 \CDR@CodeEngineApply{<placeholder:hilighted>}%
52 \makeatother'',
53
    single_line_template='<placeholder:number><placeholder:line>'
54
    first_line_template='<placeholder:number><placeholder:line>'
55
    second_line_template='<placeholder:number><placeholder:line>'
56
    white_line_template='<placeholder:number><placeholder:line>'
57
    black_line_template='<placeholder:number><placeholder:line>'
    block_template=r'', '% !TeX root=...
59
60 \makeatletter
61 \CDR@StyleUseTag
62 <placeholder:hilighted>%
63 \makeatother''
    def __init__(self, *args, **kvargs):
64
      super().__init__(*args, **kvargs)
65
      self.inline = self.ensure_bool(self.inline)
66

         self.firstnumber = abs(int(self.firstnumber))
116
       self.stepnumber = abs(int(self.stepnumber))
117
       self.numberblanklines = self.ensure_bool(self.numberblanklines)
118
       self.resetmargins = self.ensure_bool(self.resetmargins)
119
120
       self.samepage = self.ensure_bool(self.samepage)
```

### 3.4 Argumentsclass

```
121 class Arguments(BaseOpts):
122 cache = False
123
     debug = False
     source = ""
124
     style = "default"
     json = ""
     directory = "."
127
    texopts = TeXOpts()
128
     pygopts = PygOpts()
129
     fv_opts = FVOpts()
130
```

## 4 Controller main class

131 class Controller:

## 4.1 Static methods

```
object_hook
              Helper for json parsing.
                @staticmethod
          132
                def object_hook(d):
          133
                   __cls__ = d.get('__cls__', 'Arguments')
          134
                  if __cls__ == 'PygOpts':
          135
          136
                    return PygOpts(d)
          137
                  elif __cls__ == 'FVOpts':
          138
                    return FVOpts(d)
          139
                  elif __cls__ == 'TeXOpts':
                    return TeXOpts(d)
          140
          141
                  else:
                    return Arguments(d)
          142
```

lua\_command
lua\_command\_now
lua\_debug

```
\begin{tabular}{ll} self.lua\_command(\langle asynchronous\ lua\ command \rangle) \\ self.lua\_command\_now(\langle synchronous\ lua\ command \rangle) \\ \end{tabular}
```

Wraps the given command between markers. It will be in the output of the coder-tool.py, further captured by coder-util.lua and either forwarded to TeX of executed synchronously.

```
@staticmethod
143
     def lua_command(cmd):
144
       print(f'<<<<*LUA:{cmd}>>>>')
145
     @staticmethod
146
     def lua_command_now(cmd):
147
       print(f'<<<<!LUA:{cmd}>>>>')
148
     @staticmethod
149
150
     def lua_debug(msg):
       print(f'<<<<?LUA:{msg}>>>>')
151
```

lua\_text\_escape

```
self.lua\_text\_escape(\langle text \rangle)
```

Wraps the given command between [=...=[ and ]=...=] with as many equal signs as necessary to ensure a correct lua syntax.

## 4.2 Computed properties

self.json\_p The full path to the json file containing all the data used for the processing.

```
(End definition for self.json_p. This variable is documented on page ??.)
```

```
_json_p = None
          159
               @property
          160
               def json_p(self):

## 3 Constants

```
\c_CDR_tag Paths of L3keys modules.

These are root path components used throughout the pakage.

21 \str_const:Nn \c_CDR_Tags { CDR@Tags }

22 \str_const:Nx \c_CDR_tag { \c_CDR_Tags/tag }

(End definition for \c_CDR_tag and \c_CDR_Tags. These variables are documented on page ??.)

\c_CDR_tag_get Root identifier for tag properties, used throughout the pakage.

\c_CDR_slash

23 \str_const:Nn \c_CDR_tag_get { CDR@tag@get }

24 \str_const:Nx \c_CDR_slash { \tl_to_str:n {/} }

(End definition for \c_CDR_tag_get and \c_CDR_slash. These variables are documented on page ??.)
```

# 4 Implementation details

As far as possible, macro making assignments to variables are protected. All variables following expl3 naming conventions are implementation details and therefore must be considered private.

# 5 Variables

# 5.1 Internal scratch variables

These local variables are used in a very limited scope.

```
\1_CDR_bool Local scratch variable.
             25 \bool_new:N \l_CDR_bool
                (End definition for \l_CDR_bool. This variable is documented on page ??.)
   \1_CDR_tl Local scratch variable.
             26 \tl_new:N \l_CDR_tl
                (End definition for \l_CDR_tl. This variable is documented on page ??.)
  \1_CDR_str Local scratch variable.
             27 \str_new:N \l_CDR_str
               (End definition for \l_CDR_str. This variable is documented on page ??.)
  \1_CDR_seq Local scratch variable.
             28 \seq_new:N \1_CDR_seq
                (End definition for \l_CDR_seq. This variable is documented on page ??.)
 \1_CDR_prop Local scratch variable.
             29 \prop_new:N \1_CDR_prop
                (End definition for \1_CDR_prop. This variable is documented on page ??.)
\l_CDR_clist The comma separated list of current chunks.
             30 \clist_new:N \l_CDR_clist
                (End definition for \l_CDR_clist. This variable is documented on page ??.)
               5.2
                       Files
   \1_CDR_in Input file identifier
             31 \ior_new:N \l_CDR_in
               (End definition for \1_CDR_in. This variable is documented on page ??.)
  \1_CDR_out Output file identifier
             32 \iow_new:N \l_CDR_out
```

(End definition for \1\_CDR\_out. This variable is documented on page ??.)

### 5.3 Global variables

```
Line number counter for the source code chunks.
   \g_CDR_source_int Chunk number counter.
                      33 \int_new:N \g_CDR_source_int
                         (End definition for \g_CDR_source_int. This variable is documented on page ??.)
  \g_CDR_source_prop Global source property list.
                      34 \prop_new:N \g_CDR_source_prop
                         (End definition for \g_CDR_source_prop. This variable is documented on page ??.)
    \g_CDR_chunks_tl The comma separated list of current chunks. If the next list of chunks is the same as the
    \l_CDR_chunks_tl current one, then it might not display.
                      35 \tl_new:N \g_CDR_chunks_tl
                      36 \tl_new:N \l_CDR_chunks_tl
                         (End definition for \g_CDR_chunks_tl and \l_CDR_chunks_tl. These variables are documented on page
          \g_CDR_vars Tree storage for global variables.
                      37 \prop_new:N \g_CDR_vars
                         (End definition for \g_CDR_vars. This variable is documented on page ??.)
      \g_CDR_hook_tl Hook general purpose.
                      38 \tl_new:N \g_CDR_hook_tl
                         (End definition for \g_CDR_hook_tl. This variable is documented on page ??.)
\g/CDR/Chunks/<name> List of chunk keys for given named code.
                         (End definition for \g/CDR/Chunks/<name>. This variable is documented on page ??.)
                         5.4
                               Local variables
    \l_CDR_keyval_tl keyval storage.
                      39 \tl_new:N \l_CDR_keyval_tl
                         (\mathit{End \ definition \ for \ \ \ } \mathsf{L\_CDR\_keyval\_tl}. \ \mathit{This \ variable \ is \ documented \ on \ page \ \ref{eq:condition}.})
   \l_CDR_options_tl options storage.
                      40 \tl_new:N \l_CDR_options_tl
                         (End definition for \1_CDR_options_tl. This variable is documented on page ??.)
  \1_CDR_recorded_tl Full verbatim body of the CDR environment.
                      41 \tl_new:N \l_CDR_recorded_tl
                         (End definition for \l_CDR_recorded_tl. This variable is documented on page ??.)
           \g_CDR_int Global integer to store linenos locally in time.
```

```
42 \int_new:N \g_CDR_int

(End definition for \g_CDR_int. This variable is documented on page ??.)

\l_CDR_line_tl Token list for one line.

43 \tl_new:N \l_CDR_line_tl

(End definition for \l_CDR_line_tl. This variable is documented on page ??.)

\l_CDR_lineno_tl Token list for lineno display.

44 \tl_new:N \l_CDR_lineno_tl

(End definition for \l_CDR_lineno_tl. This variable is documented on page ??.)

\l_CDR_name_tl Token list for chunk name display.

45 \tl_new:N \l_CDR_name_tl

(End definition for \l_CDR_name_tl. This variable is documented on page ??.)

\l_CDR_info_tl Token list for the info of line.

46 \tl_new:N \l_CDR_info_tl

(End definition for \l_CDR_info_tl. This variable is documented on page ??.)
```

# 6 Tag properties

The tag properties concern the code chunks. They are set from different path, such that \l\_keys\_path\_str must be properly parsed for that purpose. Commands in this section and the next ones contain CDR\_tag.

The  $\langle tag \ names \rangle$  starting with a double underscore are reserved by the package.

# 6.1 Helpers

\g\_CDR\_tag\_path\_seq Global variable to store relative key path. Used for automatic management to know what has been defined explicitly.

```
47 \seq_new:N \g_CDR_tag_path_seq

(End definition for \g_CDR_tag_path_seq. This variable is documented on page ??.)
```

```
\CDR_tag_get_path:cc \star \CDR_tag_get_path:cc \{\langle tag\ name \rangle\} \{\langle relative\ key\ path \rangle\} \CDR_tag_get_path:c \star \CDR_tag_get_path:c \{\langle relative\ key\ path \rangle\}
```

Internal: return a unique key based on the arguments. Used to store and retrieve values. In the second version, the  $\langle tag \; name \rangle$  is not provided and set to \_\_local.

```
48 \cs_new:Npn \CDR_tag_get_path:cc #1 #2 {
49 \c_CDR_tag_get @ #1 / #2
50 }
51 \cs_new:Npn \CDR_tag_get_path:c {
52 \CDR_tag_get_path:cc { __local }
53 }
```

#### 6.2 Set

\CDR\_tag\_set:ccn \CDR\_tag\_set:ccV

```
\label{local_condition} $$ \CDR_{tag\_set:ccn} {\langle tag\_name \rangle} {\langle relative\_key\_path \rangle} {\langle value \rangle} $$
```

Store  $\langle value \rangle$ , which is further retrieved with the instruction  $\CDR_{tag_get:cc} {\langle tag_name \rangle} {\langle relative_key_path \rangle}$ . Only  $\langle tag_name \rangle$  and  $\langle relative_key_path \rangle$  containing no @ character are supported. Record the relative key path (the part after the tag\_name) of the current full key path in g\_CDR\_tag\_path\_seq. All the affectations are made at the current TeX group level. Nota Bene:  $\cs_generate_variant:Nn$  is buggy when there is a 'c' argument.

```
54 \cs_new_protected:Npn \CDR_tag_set:ccn #1 #2 #3 {
                      \seq_put_left:Nx \g_CDR_tag_path_seq { #2 }
                 55
                      \cs_set:cpn { \CDR_tag_get_path:cc { #1 } { #2 } } { \exp_not:n { #3 } }
                 56
                 57 }
                 58 \cs_new_protected:Npn \CDR_tag_set:ccV #1 #2 #3 {
                      \exp_args:NnnV
                 59
                      \CDR_tag_set:ccn { #1 } { #2 } #3
                 60
\c_CDR_tag_regex To parse a l3keys full key path.
                 62 \tl set:Nn \l CDR tl { /([^{/}]*)/(.*)$ } \use none:n { $ }
                 63 \tl_put_left:NV \l_CDR_tl \c_CDR_tag
                 64 \tl_put_left:Nn \l_CDR_tl { ^ }
                 65 \exp_args:NNV
                 66 \regex_const:Nn \c_CDR_tag_regex \l_CDR_tl
                    (\textit{End definition for } \verb|\c_CDR_tag_regex|. \textit{This variable is documented on page \ref{eq:constraint}.)
```

\CDR\_tag\_set:n

```
\CDR_tag_set:n {\(\forall value\)\)}
```

The value is provided but not the  $\langle dir \rangle$  nor the  $\langle relative\ key\ path \rangle$ , both are guessed from  $\l_keys_path_str$ . More precisely,  $\l_keys_path_str$  is expected to read something like  $\c_CDR_tag/\langle tag\ name \rangle/\langle relative\ key\ path \rangle$ , an exception is raised on the contrary. This is meant to be call from  $\ensuremath{\cline{keys_define:nn}}$  argument. Implementation detail: the last argument is parsed by the last command.

```
67 \cs_new:Npn \CDR_tag_set:n {
    \exp_args:NnV
68
    \regex_extract_once:NnNTF \c_CDR_tag_regex
69
70
        \l_keys_path_str \l_CDR_seq {
      \CDR_tag_set:ccn
71
        { \sim \n \l CDR_seq 2 }
72
        { \sim \n \l CDR_seq 3 }
73
    } {
74
75
      \PackageWarning
76
        { coder }
        { Unexpected~key~path~'\l_keys_path_str' }
77
      \use_none:n
78
79
    }
80 }
```

#### \CDR\_tag\_set:

\CDR\_tag\_set:

None of  $\langle dir \rangle$ ,  $\langle relative\ key\ path \rangle$  and  $\langle value \rangle$  are provided. The latter is guessed from  $\l_keys\_value\_tl$ , and  $CDR\_tag\_set:n$  is called. This is meant to be call from  $\keys\_define:nn$  argument.

```
81 \cs_new:Npn \CDR_tag_set: {
82  \exp_args:NV
83  \CDR_tag_set:n \l_keys_value_tl
84 }
```

## \CDR\_tag\_set:cn

 $\label{eq:cdr} $$ \CDR_{tag_set:cn {\langle key path \rangle} } {\langle value \rangle} $$$ 

When the last component of \l\_keys\_path\_str should not be used to store the \( \nabla alue \), but \( \nabla key path \) should be used instead. This last component is replaced and \( \nabla DR\_tag\_set: n \) is called afterwards. Implementation detail: the second argument is parsed by the last command of the expansion.

```
85 \cs_new:Npn \CDR_tag_set:cn #1 {
     \exp_args:NnV
86
     \regex_extract_once:NnNTF \c_CDR_tag_regex
87
         \l_keys_path_str \l_CDR_seq {
88
89
       \CDR_tag_set:ccn
         { \seq_item: Nn \l_CDR_seq 2 }
90
91
         { #1 }
92
    } {
       \PackageWarning
93
94
         { coder }
         { Unexpected~key~path~'\l_keys_path_str' }
95
       \use_none:n
96
    }
97
98 }
```

### \CDR\_tag\_choices:

\CDR\_tag\_choices:

Ensure that the \l\_keys\_path\_str is set properly. This is where a syntax like \keys\_set:nn {...} { choice/a } is managed.

```
99 \regex_const:Nn \c_CDR_root_regex { ^(.*)/.*$ } \use_none:n { $ }
100 \cs_new:Npn \CDR_tag_choices: {
     \exp_args:NVV
     \str_if_eq:nnT \l_keys_key_tl \l_keys_choice_tl {
102
       \exp_args:NnV
103
       \regex_extract_once:NnNT \c_CDR_root_regex
104
105
            \l_keys_path_str \l_CDR_seq {
106
          \str_set:Nx \l_keys_path_str {
            \seq_item:Nn \l_CDR_seq 2
107
108
       }
109
     }
110
111 }
```

\CDR\_tag\_choices\_set:

\CDR\_tag\_choices\_set:

Calls \CDR\_tag\_set:n with the content of \l\_keys\_choice\_tl as value. Before, ensure that the \l\_keys\_path\_str is set properly.

```
112 \cs_new:Npn \CDR_tag_choices_set: {
113 \CDR_tag_choices:
114 \exp_args:NV
115 \CDR_tag_set:n \l_keys_choice_tl
116 }
```

\CDR\_if\_tag\_truthy:cc<u>TF</u> \* \CDR\_if\_tag\_truthy:cc<u>TF</u> \*

```
\label{lem:cdr} $$ \CDR_if_truthy:ccTF {\langle tag\ name \rangle} {\langle relative\ key\ path \rangle} {\langle true\ code \rangle} {\langle false\ code \rangle} $$
```

 $\verb|\CDR_if_truthy:cTF {| \langle relative key path \rangle}| {| \langle true code \rangle}| {| \langle false code \rangle}|$ 

Execute  $\langle true\ code \rangle$  when te property for  $\langle tag\ name \rangle$  and  $\langle relative\ key\ path \rangle$  is a truthy value,  $\langle false\ code \rangle$  otherwise. A truthy value is a text which is not "false" in a case insensitive comparison. In the second version, the  $\langle tag\ name \rangle$  is not provided and set to \_\_local.

```
117 \prg_new_conditional:Nnn \CDR_if_tag_truthy:cc { p, T, F, TF } {
     \exp_args:Ne
118
     \str compare:nNnTF {
119
        \str_lowercase:n { \CDR_tag_get:cc { #1 } { #2 } }
120
121
     } = { false } {
        \prg_return_false:
123
     } {
124
        \prg_return_true:
     }
125
126 }
127 \prg_new_conditional:Nnn \CDR_if_tag_truthy:c { p, T, F, TF } {
128
     \exp_args:Ne
     \str_compare:nNnTF {
129
        \str_lowercase:n { \CDR_tag_get:c { #1 } }
130
131
     } = { false } {
132
        \prg_return_false:
133
     }
134
        \prg_return_true:
     }
135
136 }
```

\CDR\_if\_truthy:n<u>TF</u>
\CDR\_if\_truthy:e<u>TF</u>

 $\verb|\CDR_if_truthy:nTF {| \langle token \ list \rangle|} \ \{ \langle true \ code \rangle \} \ \{ \langle false \ code \rangle \}$ 

Execute  $\langle true\ code \rangle$  when  $\langle token\ list \rangle$  is a truthy value,  $\langle false\ code \rangle$  otherwise. A truthy value is a text which leading character, if any, is none of "fFnN".

```
137 \prg_new_conditional:Nnn \CDR_if_truthy:n { p, T, F, TF } {
138  \exp_args:Nf
139  \str_compare:nNnTF { \str_lowercase:n { #1 } } = { false } {
140   \prg_return_false:
141        } {
142        \prg_return_true:
143        }
144    }
145 \prg_generate_conditional_variant:Nnn \CDR_if_truthy:n { e } { p, T, F, TF }
```

\CDR\_tag\_boolean\_set:n

```
\verb|\CDR_tag_boolean_set:n \{\langle choice \rangle\}|
```

Calls \CDR\_tag\_set:n with true if the argument is truthy, false otherwise.

```
146 \cs_new_protected:Npn \CDR_tag_boolean_set:n #1 {
147 \CDR_if_truthy:nTF { #1 } {
148 \CDR_tag_set:n { true }
149 } {
150 \CDR_tag_set:n { false }
151 }
152 }
153 \cs_generate_variant:Nn \CDR_tag_boolean_set:n { x }
```

## 6.3 Retrieving tag properties

Internally, all tag properties are collected with a full key path like  $\c_CDR_tag_get/\langle tag name \rangle/\langle relative key path \rangle$ . When typesetting some code with either the  $\c CDR_tag_get/$  command or the CDRBlock environment, all properties defined locally are collected under the reserved  $\c_CDR_tag_get/_local/\langle relative path \rangle$  full key paths. The l3keys module  $\c_CDR_tag_get/_local$  is modified in  $\c TEX$  groups only. For running text code chunks, this module inherits from

- 1. \c\_CDR\_tag\_get/\langle tag name \rangle for the provided \langle tag name \rangle,
- 2. \c\_CDR\_tag\_get/default.code
- 3. \c\_CDR\_tag\_get/default
- 4. \c\_CDR\_tag\_get/\_\_pygments
- 5. \c\_CDR\_tag\_get/\_\_fancyvrb
- 6. \c\_CDR\_tag\_get/\_\_fancyvrb.all when no using pygments

For text block code chunks, this module inherits from

- 1.  $\c_{CDR\_tag\_get}/\langle name_1 \rangle$ , ...,  $\c_{CDR\_tag\_get}/\langle name_n \rangle$  for each tag name of the ordered tags list
- 2. \c\_CDR\_tag\_get/default.block
- 3. \c\_CDR\_tag\_get/default
- 4. \c\_CDR\_tag\_get/\_\_pygments
- 5. \c\_CDR\_tag\_get/\_\_pygments.block
- 6. \c\_CDR\_tag\_get/\_\_fancyvrb
- 7. \c\_CDR\_tag\_get/\_\_fancyvrb.block
- 8. \c\_CDR\_tag\_get/\_\_fancyvrb.all when no using pygments

```
\begin{tabular}{ll} $$ \CDR_tag_if_exist_here:ccTF {$\langle tag\ name \rangle$} & \code \\ \hline & \code \\ \end{tabular} $$ & \code \\ \end{tabu
```

If the  $\langle relative\ key\ path \rangle$  is known within  $\langle tag\ name \rangle$ , the  $\langle true\ code \rangle$  is executed, otherwise, the  $\langle false\ code \rangle$  is executed. No inheritance.

```
154 \prg_new_conditional:Nnn \CDR_tag_if_exist_here:cc { T, F, TF } {
155  \cs_if_exist:cTF { \CDR_tag_get_path:cc { #1 } { #2 } } {
156   \prg_return_true:
157      } {
158      \prg_return_false:
159      }
160 }
```

 $\label{eq:cdr_tag_if_exist:cc} $$ \CDR_{tag_if_exist:c} \times \CDR_{tag_if_exist:c} \times $$$ 

```
\label{lem:code} $$ \CDR_tag_if_exist:ccTF {\langle tag\ name \rangle} \ \langle relative\ key\ path \rangle \ \{\langle true\ code \rangle\} \ \CDR_tag_if_exist:cTF \ \langle relative\ key\ path \rangle \ \{\langle true\ code \rangle\} \ \{\langle false\ code \rangle\} $$
```

If the  $\langle relative\ key\ path \rangle$  is known within  $\langle tag\ name \rangle$ , the  $\langle true\ code \rangle$  is executed, otherwise, the  $\langle false\ code \rangle$  is executed if none of the parents has the  $\langle relative\ key\ path \rangle$  on its own. In the second version, the  $\langle tag\ name \rangle$  is not provided and set to \_\_local.

```
161 \prg_new_conditional:Nnn \CDR_tag_if_exist:cc { T, F, TF } {

#### 6.4 Inheritance

When a child inherits from a parent, all the keys of the parent that are not inherited are made available to the child (inheritance does not jump over generations).

```
\CDR_tag_parent_seq:c *
```

```
\CDR_tag_parent_seq:c \{\langle tag name \rangle\}
```

Return the name of the sequence variable containing the list of the parents. Each child has its own sequence of parents.

```
245 \cs_new:Npn \CDR_tag_parent_seq:c #1 {
246   g_CDR:parent.tag @ #1 _seq
247 }
```

```
\CDR_tag_inherit:cn
\CDR_tag_inherit:(cf|cV)
```

\CDR\_tag\_inherit:cn  $\{\langle child\ name \rangle\}$   $\{\langle parent\ names\ comma\ list \rangle\}$  Set the parents of  $\langle child\ name \rangle$  to the given list.

```
248 \cs_new:Npn \CDR_tag_inherit:cn #1 #2 {
     \seq_set_from_clist:cn { \CDR_tag_parent_seq:c { #1 } } { #2 }
249
     \seq_remove_duplicates:c \l_CDR_tl
250
     \seq_remove_all:cn \l_CDR_tl {}
251
     \seq_put_right:cn \l_CDR_tl { \q_no_value }
252
253 }
   \cs_new:Npn \CDR_tag_inherit:cf {
254
     \exp_args:Nnf \CDR_tag_inherit:cn
255
256 }
   \cs_new:Npn \CDR_tag_inherit:cV {
     \exp_args:NnV \CDR_tag_inherit:cn
259 }
```

# 7 Cache management

If there is no  $\langle jobname \rangle$  aux file, there should be no cached files either, coder-util.lua is asked to clean all of them, if any.

```
260 \AddToHook { begindocument/before } {
261  \IffileExists {./\jobname.aux} {} {
262   \lua_now:n {CDR:cache_clean_all()}
263   }
264 }
```

At the end of the document, coder-util.lua is asked to clean all unused cached files that could come from a previous process.

```
265 \AddToHook { enddocument/end } {
266   \lua_now:n {CDR:cache_clean_unused()}
267 }
```

#### 8 Utilities

\CDR\_clist\_map\_inline:Nnn

```
\label{localist_map_inline:Nnn (clist var) {(empty code)} {(non empty code)}} \\
```

Execute \( \)empty code \( \) when the list is empty, otherwise call \( \)clist\_map\_inline: \( \)Nn with \( \)non empty code \( \).

```
\CDR_if_block_p: *
\CDR_if_block: TF *
```

 $\verb|\CDR_if_block:TF {| \langle true \ code \rangle| } {| \langle false \ code \rangle|}$ 

Execute  $\langle true\ code \rangle$  when inside a code block,  $\langle false\ code \rangle$  when inside an inline code. Raises an error otherwise.

\CDR\_process\_record:

Record the current line or not. The default implementation does nothing and is meant to be defines locally.

```
281 \cs_new:Npn \CDR_process_record: {}
```

# 9 l3keys modules for code chunks

All these modules are initialized at the beginning of the document using the \_\_initialize meta key.

#### 9.1 Utilities

```
\label{local_condition} $$ \CDR_{tag_keys_define:nn {\langle module base \rangle} {\langle keyval list \rangle} $$
\CDR_tag_keys_define:nn
                               The \( \module \) is uniquely based on \( \module \) base \( \) before forwarding to \( \keys_define:nn. \)
                           282 \cs_generate_variant:Nn \keys_define:nn { Vn, xn }
                           283 \cs_new:Npn \CDR_tag_keys_define:nn #1 {
                                  \keys_define:xn { \c_CDR_tag / \exp_not:n { #1 } }
                           284
                           285 }
                           286 \cs_generate_variant:Nn \CDR_tag_keys_define:nn { nx }
                               \label{local_condition} $$ \CDR_{tag_{keys_{set:nn}} {\mbox{$\langle module base \rangle$} } {\mbox{$\langle keyval list \rangle$}} $$
   \CDR_tag_keys_set:nn
                               The \( module \) is uniquely based on \( module \) before forwarding to \( keys_set:nn. \)
                           287 \cs_new:Npn \CDR_tag_keys_set:nn #1 {
                                  \exp_args:Nx
                           288
                           289
                                  \keys_set:nn { \c_CDR_tag / \exp_not:n { #1 } }
                           290 }
                           291 \cs_generate_variant:Nn \CDR_tag_keys_set:nn { nV }
                               9.1.1
                                        Handling unknown tags
                               While using \keys_set:nn and variants, each time a full key path matching the pat-
                               tern \c_CDR_tag/\langletag name\rangle/\langle\rangle relative key path\rangle is not recognized, we assume that
                               the client implicitly wants a tag with the given (tag name) to be defined. For that
                               purpose, we collect unknown keys with \keys_set_known:nnnN then process them to
                               find each (tag name) and define the new tag accordingly. A similar situation occurs for
                               display engine options where the full key path reads \c_CDR_tag/\(\lambda tag name\)/\(\lambde \)/\(\lambda engine \)
                               name engine options where engine name is not known in advance.
                               \label{local_condition} $$ \CDR_{keys\_set\_known:nnN} {\langle module \rangle} {\langle key[=value] items \rangle} {\langle t1 var \rangle} $$
\CDR keys set known:nnN
                               Wrappers over \keys_{set_known:nnnN} where the \langle root \rangle is also the \langle module \rangle.
                           292 \cs_new:Npn \CDR_keys_set_known:nnN #1 #2 {
                                  \keys_set_known:nnnN { #1 } { #2 } { #1 }
                           293
                           294 }

## 9.2 pygments

These are pygments's LatexFormatter options, that are not covered by \_\_fancyvrb. They are made available at the end user level, but may not be relevant when pygments is nor used.

#### 9.2.1 Utilities

```
\CDR_has_pygments_p: \star \CDR_has_pygments: \underline{TF}
```

```
\verb|\CDR_has_pygments:TF {| \langle true \ code \rangle | } {| \langle false \ code \rangle |}
```

Execute  $\langle true\ code \rangle$  when pygments is available,  $\langle false\ code \rangle$  otherwise. *Implementation detail*: we define the conditionals and set them afterwards.

```
376 \sys_get_shell:nnN {which~pygmentize} {} \l_CDR_tl
377 \prg_new_conditional:Nnn \CDR_has_pygments: { p, T, F, TF } { }
378 \tl_if_in:NnTF \l_CDR_tl { pygmentize } {
379 \prg_set_conditional:Nnn \CDR_has_pygments: { p, T, F, TF } {
380 \prg_return_true:
381 }
382 } {
383 \prg_set_conditional:Nnn \CDR_has_pygments: { p, T, F, TF } {
384 \prg_return_false:
385 }
386 }
```

#### 9.2.2 \_\_pygments | I3keys module

```
387 \CDR_tag_keys_define:nn { __pygments } {
```

lang=(language name) where (language name) is recognized by pygments, including a
void string,

```
lang .code:n = \CDR_tag_set:,
lang .value_required:n = true,
```

pygments[=true|false] whether pygments should be used for syntax coloring. Initially true if pygments is available, false otherwise.

```
pygments .code:n = \CDR_tag_boolean_set:x { #1 },
```

style=(style name) where (style name) is recognized by pygments, including a void string,

```
style .code:n = \CDR_tag_set:,
style .value_required:n = true,
```

**commandprefix=**⟨text⟩ The LATEX commands used to produce colored output are constructed using this prefix and some letters. Initially PY.

```
393 commandprefix .code:n = \CDR_tag_set:,
394 commandprefix .value_required:n = true,
```

mathescape[=true|false] If set to true, enables IATEX math mode escape in comments.

That is, \$...\$ inside a comment will trigger math mode. Initially false.

```
mathescape .code:n = \CDR_tag_boolean_set:x { #1 },
mathescape .default:n = true,
```

escapeinside=\langle before \rangle \langle after \rangle If set to a string of length 2, enables escaping to IATEX. Text delimited by these 2 characters is read as IATEX code and typeset accordingly. It has no effect in string literals. It has no effect in comments if texcomments or mathescape is set. Initially empty.

escapeinside .code:n = \CDR\_tag\_set:,

397

```
escapeinside .value_required:n = true,
398
   __initialize Initializer.
     __initialize .meta:n = {

420 \AtBeginDocument{

419 }

421

422 }

#### 9.3.1 default l3keys module

```
423 \CDR_tag_keys_define:nn { default } {
```

\CDR\_tag\_keys\_set:nn { \_\_pygments.block } { \_\_initialize }

Keys are:

format=\langle format commands \rangle the format used to display the code (mainly font, size and color), after the font has been selected. Initially empty.

```
format .code:n = \CDR_tag_set:,
format .value_required:n = true,
```

cache Set to true if coder-tool.py should use already existing files instead of creating new ones. Initially true.

```
426 cache .code:n = \CDR_tag_boolean_set:x { #1 },
```

debug Set to true if various debugging messages should be printed to the console.
Initially false.

```
debug .code:n = \CDR_tag_boolean_set:x { #1 },
```

post processor=(command) the command for pygments post processor. This is a string where every occurrence of "%%file%%" is replaced by the full path of the \*.pyg.tex file to be post processed and then executed as terminal instruction. Initially empty.

```
428 post~processor .code:n = \CDR_tag_set:,
429 post~processor .value_required:n = true,
```

parskip the value of the \parskip in code blocks,

```
parskip .code:n = \CDR_tag_set:,
parskip .value_required:n = true,
```

engine=(engine name) to specify the engine used to display inline code or blocks. Initially default.

```
engine .code:n = \CDR_tag_set:,
engine .value_required:n = true,
```

default engine options=\(default engine options\)\) to specify the corresponding options,

```
default~engine~options .code:n = \CDR_tag_set:,
default~engine~options .value_required:n = true,
```

- ⟨engine name⟩ engine options=⟨engine options⟩ to specify the options for the named engine,
- \_\_initialize to initialize storage properly. We cannot use .initial:n actions because the \l\_keys\_path\_str is not set up properly.

```
436    __initialize .meta:n = {
437     format = ,
438          cache = true,
439          debug = false,

457 }
```

the \l\_keys\_path\_str is not set up properly.

#### 9.3.3 default.block 13keys module

```
458 \CDR_tag_keys_define:nn { default.block } {
```

Known keys include:

Known keys include:

- show tags[=true|false] to enable/disable the display of the code chunks tags. Initially true.
- $\bigcirc$  tags= $\langle$ tag name comma list $\rangle$  to export and display.

tags format=⟨format commands⟩ , where ⟨format⟩ is used the format used to display the tag names (mainly font, size and color), after it is appended to the numbers format. Initially empty.

```
466 tags~format .code:n = \CDR_tag_set:,
467 tags~format .value_required:n = true,
```

• numbers format=\langle format commands \rangle , where \langle format \rangle is used the format used to display line numbers (mainly font, size and color).

```
468    numbers~format .code:n = \CDR_tag_set:,
469    numbers~format .value_required:n = true,
```

show tags=[=true|false] whether tags should be displayed.

```
show~tags .code:n = \CDR_tag_boolean_set:x { #1 },
```

only top[=true|false] to avoid chunk tags repetitions, if on the same page, two consecutive code chunks have the same tag names, the second names are not displayed.

```
only~top .code:n = \CDR_tag_boolean_set:x { #1 },
```

use margin[=true|false] to use the magin to display line numbers and tag names, or not,

```
use~margin .code:n = \CDR_tag_boolean_set:x { #1 },
```

blockskip the separation with the surrounding text, above and below. Initially \topsep.

```
473 blockskip .code:n = \CDR_tag_set:,
474 blockskip .value_required:n = true,
```

\_\_initialize the separation with the surrounding text. Initially \topsep.

```
__initialize .meta:n = {
475
476
        tags = ,
477
        show~tags = true,

490
      __initialize .value_forbidden:n = true,
491 }
492 \AtBeginDocument{
     \CDR_tag_keys_set:nn { default.block } { __initialize }
493
494 }
```

#### 9.4 fancyvrb

These are fancyvrb options verbatim. The fancyvrb manual has more details, only some parts are reproduced hereafter. All of these options may not be relevant for all situations. Some of them make no sense in code mode, whereas others may not be compatible with the display engine.

#### 

```
495 \CDR_tag_keys_define:nn { __fancyvrb } {
```

formatcom=(command) execute before printing verbatim text. Initially empty.

```
496    formatcom .code:n = \CDR_tag_set:,
497    formatcom .value_required:n = true,
```

fontfamily=\(\( family name \)\)\) font family to use. tt, courier and helvetica are predefined. Initially tt.

```
498 fontfamily .code:n = \CDR_tag_set:,
499 fontfamily .value_required:n = true,
```

fontsize=\( font size \) size of the font to use. If you use the relsize package as well, you can require a change of the size proportional to the current one (for instance: fontsize=\relsize{-2}). Initially auto: the same as the current font.

```
fontsize .code:n = \CDR_tag_set:,
fontsize .value_required:n = true,
```

fontshape=\(\forall font shape \rangle \) font shape to use. Initially auto: the same as the current font.

```
502 fontshape .code:n = \CDR_tag_set:,
503 fontshape .value_required:n = true,
```

fontseries=\(series name\) LATEX font series to use. Initially auto: the same as the current font.

```
504 fontseries .code:n = \CDR_tag_set:,
505 fontseries .value_required:n = true,
```

showspaces[=true|false] print a special character representing each space. Initially false: spaces not shown.

```
showspaces .code:n = \CDR_tag_boolean_set:x { #1 },
```

showtabs=true|false explicitly show tab characters. Initially false: tab characters not shown.

```
showtabs .code:n = \CDR_tag_boolean_set:x { #1 },
```

• obeytabs=true|false position characters according to the tabs. Initially false: tab characters are added to the current position.

```
obeytabs .code:n = \CDR_tag_boolean_set:x { #1 },
```

tabsize=(integer) number of spaces given by a tab character, Initially 2 (8 for fancyvrb).

```
tabsize .code:n = \CDR_tag_set:,
tabsize .value_required:n = true,
```

defineactive=\langle macro \rangle to define the effect of active characters. This allows to do some devious tricks, see the fancyvrb package. Initially empty.

```
defineactive .code:n = \CDR_tag_set:,
defineactive .value required:n = true,
```

**▼** reflabel=⟨label⟩ define a label to be used with \pageref. Initially empty.

```
reflabel .code:n = \CDR_tag_set:,
reflabel .value_required:n = true,
```

\_\_initialize Initialization.

```
\_initialize .meta:n = {
515
       formatcom = ,
516
       fontfamily = tt,
517
       fontsize = auto,
518
519
       fontseries = auto,
       fontshape = auto,
520
       showspaces = false,
521
522
       showtabs = false,
       obeytabs = false,
523
       tabsize = 2,
524
       defineactive = ,
525
       reflabel = ,
526
527
     __initialize .value_forbidden:n = true,
528
529 }
530 \AtBeginDocument{
      \CDR_tag_keys_set:nn { __fancyvrb } { __initialize }
531
532 }
```

#### 9.4.2 \_\_fancyvrb.block | 13keys module

Block specific options, except numbering.

frame=none|leftline|topline|bottomline|lines|single type of frame around the verbatim environment. With leftline and single modes, a space of a length given by the LATEX \fboxsep macro is added between the left vertical line and the text. Initially none: no frame.

```
frame .choices:nn =
f
```

■ label={[⟨top string⟩]⟨string⟩} label(s) to print on top, bottom or both, frame lines. If the label(s) contains special characters, comma or equal sign, it must be placed inside a group. If an optional ⟨top string⟩ is given between square brackets, it will be used for the top line and ⟨string⟩ for the bottom line. Otherwise, ⟨string⟩ is used for both the top or bottom lines. Label(s) are printed only if the frame parameter is one of topline, bottomline, lines or single. Initially empty: no label.

```
label .code:n = \CDR_tag_set:,
label .value_required:n = true,
```

labelposition=none|topline|bottomline|all position where to print the label(s) when defined. When options happen to be contradictory, like frame=topline and labelposition=bottomline, nothing is displayed. Initially none when no labels are defined, topline for one label and all otherwise.

```
540 labelposition .choices:nn =
541 { none, topline, bottomline, all }
542 { \CDR_tag_choices_set: },
```

baselinestretch=auto|\dimension\) value to give to the usual \baselinestretch IMTEX parameter. Initially auto: its current value just before the verbatim command.

```
543 baselinestretch .code:n = \CDR_tag_set:,
544 baselinestretch .value_required:n = true,
```

- **O** commandchars=\langle three characters \rangle characters which define the character which starts a macro and marks the beginning and end of a group; thus lets us introduce escape sequences in verbatim code. Of course, it is better to choose special characters which are not used in the verbatim text. Private to coder, unavailable to users.
- xleftmargin=\(dimension\)\) indentation to add at the start of each line. Initially Opt: no left margin.

```
xleftmargin .code:n = \CDR_tag_set:,
xleftmargin .value_required:n = true,
```

xrightmargin=\(dimension\)\) right margin to add after each line. Initially Opt: no right margin.

```
xrightmargin .code:n = \CDR_tag_set:,
xrightmargin .value_required:n = true,
```

resetmargins[=true|false] reset the left margin, which is useful if we are inside other indented environments. Initially true.

```
resetmargins .code:n = \CDR_tag_boolean_set:x { #1 },
```

hfuzz=\(dimension\) value to give to the TeX \hfuzz dimension for text to format. This can be used to avoid seeing some unimportant overfull box messages. Initially 2pt.

```
550 hfuzz .code:n = \CDR_tag_set:,
551 hfuzz .value_required:n = true,
```

samepage[=true|false] in very special circumstances, we may want to make sure that a verbatim environment is not broken, even if it does not fit on the current page. To avoid a page break, we can set the samepage parameter to true. Initially false.

```
samepage .code:n = \CDR_tag_boolean_set:x { #1 },
```

\_\_initialize Initialization.

```
553
      __initialize .meta:n = {
554
       frame = none,
       label = ,
555
       labelposition = none, % auto?
556
       baselinestretch = auto,
557
558
       resetmargins = true,
       xleftmargin = Opt,
559
560
       xrightmargin = Opt,
       hfuzz = 2pt,
561
       samepage = false,
562
563
     __initialize .value_forbidden:n = true,
564
565 }
566 \AtBeginDocument{
     \CDR_tag_keys_set:nn { __fancyvrb.block } { __initialize }
567
568 }
```

#### 9.4.3 \_\_fancyvrb.number | 13keys module

Block line numbering.

```
569 \CDR_tag_keys_define:nn { __fancyvrb.number } {
```

commentchar=(character) lines starting with this character are ignored. Initially empty.

```
570 commentchar .code:n = \CDR_tag_set:,
571 commentchar .value_required:n = true,
```

■ gobble=⟨integer⟩ number of characters to suppress at the beginning of each line (from 0 to 9), mainly useful when environments are indented. Only block mode.

```
572  gobble .choices:nn = {
573     0,1,2,3,4,5,6,7,8,9
574  } {
575     \CDR_tag_choices_set:
576  },
```

numbers=none|left|right numbering of the verbatim lines. If requested, this numbering is done outside the verbatim environment. Initially none: no numbering.

```
577 numbers .choices:nn =
578 { none, left, right }
579 { \CDR_tag_choices_set: },
```

numbersep=(dimension) gap between numbers and verbatim lines. Initially 12pt.

```
numbersep .code:n = \CDR_tag_set:,
numbersep .value_required:n = true,
```

firstnumber=auto|last|⟨integer⟩ number of the first line. last means that the numbering is continued from the previous verbatim environment. If an integer is given, its value will be used to start the numbering. Initially auto: numbering starts from 1.

```
582
     firstnumber .code:n = {
583
        \regex_match:NnTF \c_CDR_integer_regex { #1 } {
584
          \CDR_tag_set:
        } {
585
          \str_case:nnF { #1 } {
586

588
589
            \PackageWarning
              { CDR }
591
              { Value~'#1'~not~in~auto,~last. }
592
593
       }
594
     },
595
     firstnumber .value_required:n = true,
596
```

stepnumber=(integer) interval at which line numbers are printed. Initially 1: all lines are numbered.

```
597 stepnumber .code:n = \CDR_tag_set:,
598 stepnumber .value_required:n = true,
```

numberblanklines[=true|false] to number or not the white lines (really empty or containing blank characters only). Initially true: all lines are numbered.

```
numberblanklines .code:n = \CDR_tag_boolean_set:x { #1 },
```

• firstline=\(\(\int\) first line to print. Initially empty: all lines from the first are printed.

```
firstline .code:n = \CDR_tag_set:,
firstline .value_required:n = true,
```

lastline=(integer) last line to print. Initially empty: all lines until the last one are printed.

```
lastline .code:n = \CDR_tag_set:,
602
     lastline .value_required:n = true,
603
     initialize Initialization.
     __initialize .meta:n = {

618
619 }
           __fancyvrb.all | I3keys module
```

Options available when pygments is not used.

```
620 \CDR_tag_keys_define:nn { __fancyvrb.all } {
```

commandchars=\langle three characters \rangle characters that define the character that starts a macro and marks the beginning and end of a group; allows to introduce escape sequences in the verbatim code. Of course, it is better to choose special characters that are not used in the verbatim text! Initially none. Ignored in pygments mode.

```
621 commandchars .code:n = \CDR_tag_set:,
622 commandchars .value_required:n = true,
```

codes=(macro) to specify catcode changes. For instance, this allows us to include formatted mathematics in verbatim text. Initially empty. Ignored in pygments mode.

```
codes .code:n = \CDR_tag_set:,
codes .value_required:n = true,
```

\_\_initialize Initialization.

```
625   __initialize .meta:n = {
626     commandchars = ,
627     codes = ,
628    },
629    __initialize .value_forbidden:n = true,
630 }
631 \AtBeginDocument{
632    \CDR_tag_keys_set:nn { __fancyvrb.all } { __initialize }
633 }
```

#### 10 \CDRSet

\CDRSet

```
\CDRSet {\key[=value] list\}
\CDRSet {only description=true, font family=tt}
\CDRSet {tag/default.code/font family=sf}
```

To set up the package. This is executed at least once at the end of the preamble. The unique mandatory argument of  $\CDRSet$  is a list of  $\langle key \rangle [=\langle value \rangle]$  items defined by the CDR@Set | 13keys module.

#### 10.1 CDR@Set l3keys module

```
634 \keys_define:nn { CDR@Set } {
```

only description to typeset only the description section and ignore the implementation section.

```
only~description .choices:nn = { false, true, {} } {
    \int_compare:nNnTF \l_keys_choice_int = 1 {
     \prg_set_conditional:Nnn \CDR_if_only_description: { p, T, F, TF } { \prg_return_true: }
} {
     \prg_set_conditional:Nnn \CDR_if_only_description: { p, T, F, TF } { \prg_return_false: }
} {
     \prg_set_conditional:Nnn \CDR_if_only_description: { p, T, F, TF } { \prg_return_false: }
} {
     \proceedaddle{1} },
} only~description .initial:n = false,
```

python path if automatic processing is not available, manually setting the path to the python utility is required. Giving a void path forces an automatic guess using which.

#### 10.2 Branching

```
\label{local_cont} $$ \CDR_if_only_description:TF {$\langle true\ code \rangle$} $$ \CDR_if_only_description: $$ $$ $$ $$ $$ $$ $$ $
```

Execute  $\langle true\ code \rangle$  when only the description is expected,  $\langle false\ code \rangle$  otherwise. Implementation detail: the functions are defined as part of the CDR@Set l3keys module.

#### 10.3 Implementation

\CDR\_check\_unknown:N

```
\verb|\CDR_check_unknown:N| \{ \langle tl \ variable \rangle \}|
```

In normal situation, the argument is expected to be empty. When the argument is not empty, send a package warning for each key.

```

# 12 Style

pygments, through coder-tool.py, creates style commands, but the storage is managed on the LATEX side by coder.sty. This is a LATEX style API.

```
\CDR@StyleDefine \{\langle pygments \ style \ name \rangle\}\ \{\langle definitions \rangle\}
\CDR@StyleDefine
                    Define the definitions for the given (pygments style name).
                 808 \cs_set:Npn \CDR@StyleDefine #1 {
                      \tl_gset:cn { g_CDR@Style/#1 }
                810 }
 \CDR@StyleUse
                     \CDR@StyleUse \{\langle pygments style name \rangle\}
CDR@StyleUseTag
                    \CDR@StyleUseTag
                    Use the definitions for the given (pygments style name). No safe check is made. The
                    \CDR@StyleUseTag version finds the \(\rho pygments \) style name\(\rangle \) from the context. It is
                    defined locally.
                 811 \cs_set:Npn \CDR@StyleUse #1 {
                      \tl_use:c { g_CDR@Style/#1 }
                813 }
 \CDR@StyleExist
                    \verb|\CDR@StyleExist {| (pygments style name)|} {| (true code)|} {| (false code)|} 
                    Execute (true code) if a style exists with that given name, (false code) otherwise.
                814 \prg_new_conditional:Nnn \CDR@StyleIfExist:c { TF } {
                       \tl_if_exist:cTF { g_CDR@Style/#1 } {
                         \prg_return_true:
                 817
                      } {
                 818
                         \prg_return_false:
                 819
                      }
                 820 }
```

# 13 Creating display engines

821 \cs\_set\_eq:NN \CDR@StyleIfExist \CDR@StyleIfExist:cTF

#### 13.1 Utilities

```
\CDR_code_engine:c * \CDR_code_engine:c {\( \lambda \) engine name \)}
\CDR_block_engine:c * \CDR_block_engine:c {\( \lambda \) engine name \)}
\CDR_block_engine:c * \CDR_block_engine:c builds a command sequence name based on \( \lambda \) engine name \).
\CDR_block_engine:v * \CDR_block_engine:c builds an environment name based on \( \lambda \) engine name \).

\( \lambda \).
\( \lambda \) \CDR_block_engine:c #1 \{ \text{823} \text{CDR@colored/code/#1:nn} \\
\( \lambda \) \\( \lambda \) \\
\( \lambda \) \\
\(
```

```
827 }

829  \exp_args:NV \CDR_code_engine:c
830 }
831 \cs_new:Npn \CDR_block_engine:V {
832  \exp_args:NV \CDR_block_engine:c
833 }
\l_CDR_engine_tl Storage for an engine name.
834 \tl_new:N \l_CDR_engine_tl
(End definition for \l_CDR_engine_tl. This variable is documented on page ??.)
```

\CDRGetOption

\CDRGetOption  $\{\langle relative\ key\ path\rangle\}$ 

Returns the value given to  $\CDRCode$  command or CDRBlock environment for the  $\CDRCode$  execution is only available during  $\CDRCode$  execution and inside  $\CDRBlock$  environment.

### 13.2 Implementation

\CDRCodeEngineNew \CDRCodeEngineRenew

```
\CDRCodeEngineNew {\langle engine name\rangle}}{\langle Engine body\rangle}
\CDRCodeEngineRenew{\langle engine name\rangle}}{\langle engine body\rangle}
```

(engine name) is a non void string, once expanded. The (engine body) is a list of instructions which may refer to the first argument as #1, which is the value given for key (engine name) engine options, and the second argument as #2, which is the colored code.

```
835 \NewDocumentCommand \CDRCodeEngineNew { mm } {
     \exp_args:Nx
836
     \tl_if_empty:nTF { #1 } {
837

       \ignorespaces
846
     }
847
848 }
849 \NewDocumentCommand \CDRCodeEngineRenew { mm } {
850
     \exp_args:Nx
     \t: \t: TF { #1 } {
851
       \PackageWarning
852
853
         { coder }
         { The~engine~cannot~be~void. }
854
855
          \use none:n
     } {
856
       \cs_if_exist:cTF { \CDR_code_engine:c { #1 } } {
```

```
\cs_set:cpn { \CDR_code_engine:c { #1 } } ##1 ##2 {
858
            \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
859
            #2
860
          }
861
        } {
862
          \PackageWarning
863
            { coder }
864
865
            { No~code~engine~#1.}
866
        \ignorespaces
867
     }
868
869 }
```

#### \CDR@CodeEngineApply

#### $\verb|\CDR@CodeEngineApply {| \langle source \rangle | \}|}$

Get the code engine and apply it to the given  $\langle source \rangle$ . When the code engine is not recognized, an error is raised. *Implementation detail*: the argument is parsed by the last macro.

```
870 \cs_new:Npn \CDR@CodeEngineApply #1 {
     \CDR_tag_get:cN { engine } \l_CDR_engine_tl
     \CDR_if_code_engine:VF \l_CDR_engine_tl {
872
873
       \PackageError
874
         { coder }
         { \l_CDR_engine_tl\space code~engine~unknown,~replaced~by~'default' }
875
         {See~\CDRCodeEngineNew~in~the~coder~manual}
876
       \tl_set:Nn \l_CDR_engine_tl { default }
877
     }
878
     \tl_set:Nf \l_CDR_options_tl {
879
880
       \CDR_tag_get:c { engine~options }
881
882
     \tl_if_empty:NTF \l_CDR_options_tl {
883
       \tl_set:Nf \l_CDR_options_tl {
884
         \CDR_tag_get:c { \l_CDR_engine_tl\space engine~options }
       }
885
     } {
886
       \tl_put_left:Nx \l_CDR_options_tl {
887
         \CDR_tag_get:c { \l_CDR_engine_tl\space engine~options } ,
888
       }
889
     }
890
891
     \exp_args:NnV
     \use:c { \CDR_code_engine:V \l_CDR_engine_tl } \l_CDR_options_tl {
892
893
       \CDR_tag_get:c { format }
894
895
     }
896 }
```

\CDRBlockEngineNew \CDRBlockEngineRenew

```
\label{lockengineNew} $$ \cDRBlockEngineNew {$\langle engine\ name \rangle$} {\langle begin\ instructions \rangle$} {\langle end\ instructions \rangle$} {\langle end\ instructions \rangle$} $$
```

Create a LATEX environment uniquely named after \( \)engine name \( \), which must be a non void string once expanded. The \( \)begin instructions \( \) and \( \)end instructions \( \) are list of instructions which may refer to the unique argument as \( \)#1, which is the value given to CDRBlock environment for key \( \)engine name \( \)engine engine options. Various options are available with the \( \)CDRGetOption function. Implementation detail: the third argument is parsed by \( \)NewDocumentEnvironment.

```
897 \NewDocumentCommand \CDRBlockEngineNew { mm } {
     \NewDocumentEnvironment { \CDR_block_engine:c { #1 } } { m } {
898
       \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
901
     }
902 }
   \NewDocumentCommand \CDRBlockEngineRenew { mm } {
903
     \tl_if_empty:nTF { #1 } {
904
       \PackageWarning
905
         { coder }
906
         { The~engine~cannot~be~void. }
907
908
          \use_none:n
     } {
909
       \RenewDocumentEnvironment { \CDR_block_engine:c { #1 } } { m } {
910
         \cs_set_eq:NN \CDRGetOption \CDR_tag_get:c
911
912
       }
913
914
     }
915 }
```

#### 13.3 Conditionals

\CDR\_if\_code\_engine:c $\underline{TF}$  \*

```
\verb|\CDR_if_code_engine:cTF {|\langle engine name \rangle|} {|\langle true code \rangle|} {|\langle false code \rangle|}
```

If there exists a code engine with the given  $\langle engine \ name \rangle$ , execute  $\langle true \ code \rangle$ . Otherwise, execute  $\langle false \ code \rangle$ .

```
916 \prg_new_conditional:Nnn \CDR_if_code_engine:c { p, T, F, TF } {
     \cs_if_exist:cTF { \CDR_code_engine:c { #1 } } {
917
918
        \prg_return_true:
     }
       {
919
920
        \prg_return_false:
     }
921
922 }
   \prg_new_conditional:Nnn \CDR_if_code_engine:V { p, T, F, TF } {
923
     \cs_if_exist:cTF { \CDR_code_engine:V #1 } {
924
        \prg_return_true:
925
926
        \prg_return_false:
927
     }
928
929 }
```

\CDR\_if\_block\_engine:c $\overline{TF}$  \*

```
\label{lock_engine} $$ \CDR_if_block_engine:c {\langle engine name \rangle} {\langle true code \rangle} {\langle false code \rangle}$
```

If there exists a block engine with the given  $\langle engine name \rangle$ , execute  $\langle true code \rangle$ , otherwise, execute  $\langle false code \rangle$ .

```
930 \prg_new_conditional:Nnn \CDR_if_block_engine:c { p, T, F, TF } {
     \cs_if_exist:cTF { \CDR_block_engine:c { #1 } } {
931
932
       \prg_return_true:
     } {
933
       \prg_return_false:
934
935
936 }
937 \prg_new_conditional:Nnn \CDR_if_block_engine:V { p, T, F, TF } {
     \cs_if_exist:cTF { \CDR_block_engine:V #1 } {
938
       \prg_return_true:
941
       \prg_return_false:
     }
942
943 }
```

#### 13.4 Default code engine

The default code engine does nothing special and forwards its argument as is.

```
944 \CDRCodeEngineNew { default } { #2 }
```

#### 13.5 Default block engine

The default block engine does nothing.

```
945 \CDRBlockEngineNew { default } { } { }
```

#### 13.6 efbox code engine

```
946 \AtBeginDocument {
947  \@ifpackageloaded{efbox} {
948    \CDRCodeEngineNew {efbox} {
949    \efbox[#1]{#2}%
950    }
951  }
952 }
```

#### 13.7 Block mode default engine

```
953 \CDRBlockEngineNew {} {
954 } {
955 }
```

#### 13.8 tcolorbox related engine

If the tcolorbox is loaded, related code and block engines are available.

# 14 \CDRCode function

#### 14.1 API

\CDRCode

 $\verb|\CDRCode|{\key[=value]|}|{\delimiter}|{\delimiter}|{\delimiter}|$ 

Public method to declare inline code.

#### 14.2 Storage

```
\l_CDR_tag_tl To store the tag given.
```

```
956 \tl_new:N \l_CDR_tag_tl
```

 $(\mathit{End \ definition \ for \ \ } \texttt{L\_CDR\_tag\_tl}. \ \mathit{This \ variable \ is \ documented \ on \ page \ \ref{eq:local_tag_tl}.})$ 

#### 14.3 \_\_code l3keys module

This is the module used to parse the user interface of the \CDRCode command.

```
957 \CDR_tag_keys_define:nn { __code } {
```

**▼ tag=**⟨name⟩ to use the settings of the already existing named tag to display.

```
958 tag .tl_set:N = \l_CDR_tag_tl,
959 tag .value_required:n = true,
```

engine options=\langle engine options \rangle options forwarded to the engine. They are appended to the options given with key \langle engine name \rangle engine options.

```
960 engine~options .code:n = \CDR_tag_set:,
961 engine~options .value_required:n = true,
```

\_\_initialize initialize

```
962   __initialize .meta:n = {
963     tag = default,
964     engine~options = ,
965     },
966     __initialize .value_forbidden:n = true,
967 }
```

#### 14.4 Implementation

\CDR\_code\_format:

\CDR\_code\_format:

Private utility to setup the formatting.

```
\tilde{f}_in:nnTF { #1 } { , } { #1 } { #1 } { #1 } } { #1 } } } } } 
          969
          970 }
          971 \cs_generate_variant:Nn \CDR_brace_if_contains_comma:n { V }

#### 15 CDRBlock environment

 $\label{eq:cdrblock} $$\operatorname{CDRBlock}_{\langle key[=value] \ list} \ldots \ \end_{CDRBlock}$$$ 

#### 15.1 Storage

```
\1_CDR_block_prop
```

```
1076 \prop_new:N \l_CDR_block_prop

(End definition for \l_CDR_block_prop. This variable is documented on page ??.)
```

#### 15.2 \_\_block l3keys module

This module is used to parse the user interface of the CDRBlock environment.

```
1077 \CDR_tag_keys_define:nn { __block } {
```

no export[=true|false] to ignore this code chunk at export time.

```
no~export .code:n = \CDR_tag_boolean_set:x { #1 },
no~export .default:n = true,
```

no export format=\(\format\) commands\(\righta\) a format appended to tags format and numbers format when no export is true.. Initially empty.

```
1080 no~export~format .code:n = \CDR_tag_set:,
1081 no~export~format .value_required:n = true,
```

• test[=true|false] whether the chunk is a test,

```
test .code:n = \CDR_tag_boolean_set:x { #1 },
test .default:n = true,
```

engine options=\langle engine options \rangle options forwarded to the engine. They are appended to the options given with key \langle engine name \rangle engine options. Mainly a convenient user interface shortcut.

```
engine~options .code:n = \CDR_tag_set:,
engine~options .value_required:n = true,
```

\_\_initialize initialize

```
1086    __initialize .meta:n = {
1087         no~export = false,
1088         no~export~format = ,
1089         test = false,
1090         engine~options = ,
1091    },
1092    __initialize .value_forbidden:n = true,
1093 }
```

#### 15.3 Context

Inside the CDRBlock environments, some local variables are available:

#### 15.4 Implementation

We start by saving some fancyvrb macros that we further want to extend. The unique mandatory argument of these macros will eventually be recorded to be saved later on.

```
1094 \clist_map_inline:nn { i, ii, iii, iv } {
1095
      \cs_set_eq:cc { CDR@ListProcessLine@ #1 } { FV@ListProcessLine@ #1 }
1096 }
1097 \cs_new:Npn \CDR_process_line:n #1 {
1098
      \str_set:Nn \l_CDR_str { #1 }
      \lua_now:n {CDR:record_line('l_CDR_str')}
1099
1100 }
1101 \def\FVB@CDRBlock #1 {
      \@bsphack
1102
1103
      \group_begin:
1104
      \prg_set_conditional:Nnn \CDR_if_block: { p, T, F, TF } {
1105
        \prg_return_true:
      }
1106
      \CDR_tag_keys_set:nn { __block } { __initialize }
1107
```

By default, this code chunk will have the same list of tags as the last code block or last \CDRExport stored in \g\_CDR\_tags\_clist.

```
\clist_set_eq:NN \l_CDR_tags_clist \g_CDR_tags_clist

#### 17 More

 $\verb|\CDR_if_record: \underline{\mathit{TF}}| \star$ 

```
\verb|\CDR_if_record:TF {| \langle true \ code \rangle}| \ \{ \langle false \ code \rangle \}|
```

Execute  $\langle true\ code \rangle$  when code should be recorded,  $\langle false\ code \rangle$  otherwise. The code should be recorded for the CDRBlock environment when there is a non empty list of tags and pygments is used. *Implementation details*: we assume that if \l\_CDR\_tags\_clist is not empty then we are in a CDRBlock environment.

```

### 20 Section separators

\CDRImplementation \CDRFinale

\CDRImplementation \CDRFinale

\CDRImplementation start an implementation part where all the sectioning commands do nothing, whereas \CDRFinale stop an implementation part.
